

Coastal Observation Programme — Engineering (C.O.P.E.)

Point Vernon — City of Hervey Bay

For the years 1977 to 1988

**Beach Protection
Authority
Queensland**

March 1993

This report was prepared by the Coastal Management Branch, Division of Conservation, Department of Environment and Heritage on behalf of the Beach Protection Authority.

All reasonable care and attention has been exercised in the collection, processing and compilation of the C.O.P.E. data included in this report. However, the accuracy and reliability of this information is not guaranteed in any way by the Beach Protection Authority and the Authority accepts no responsibility for the use of this information in any way whatsoever.

Documentation

Report No.: C29.1
Title: Coastal Observation Programme - Engineering (C.O.P.E.) Point Vernon - City of Hervey Bay
Date: March 1993
Type of report: Technical memorandum
Prepared by: Coastal Management Branch, Division of Conservation, Queensland Department of Environment and Heritage on behalf of the Beach Protection Authority.
Issuing organisation: Beach Protection Authority
PO Box 155
BRISBANE ALBERT STREET
QLD 4002
AUSTRALIA
Distribution: Public distribution

Abstract

This report provides a summary of primary analyses of C.O.P.E. data on wind, wave and beach processes observed at Point Vernon in the City of Hervey Bay, on the south Queensland coast. The data was recorded by volunteer observers during the period March 1977 to November 1988. The Beach Protection Authority wishes to thank all observers in the recording of data at the C.O.P.E. Station. The information published is considered representative of the long term conditions. The station was closed in November 1988.

1.0 Introduction

1.1 The programme

The Beach Protection Authority requires basic data on the behaviour of Queensland's beaches in order to provide well founded advice on coastal management to Local Authorities. The C.O.P.E. project aims to collect information on wind, waves and beach behaviour in areas where extensive investigations are not practical and where otherwise little or no data exist.

The project is based on the recruitment of volunteer observers who are prepared to record a series of basic parameters daily for at least a three year period.

1.2 Site selection

In selecting a site for a C.O.P.E. station, consideration is given to:

- (a) the general shoreline configuration and the possibility of extrapolation of data to other adjacent beaches;
- (b) the distribution of stations along Queensland's coastline; and
- (c) the need to correlate the C.O.P.E. data with planned or existing data collection programmes.

1.3 Instrumentation

The C.O.P.E. observers are supplied with a basic kit of recording instruments including:

- 30 metre tape, wind meter, stop watch, 2.0 metre measuring sticks, recording forms and fluorescent dye.

1.4 Observers

The majority of C.O.P.E. observers are volunteers, who may be local business people, local residents or school children. Some stations are operated by Government and Local Authority employees who carry out the observations as part of their official duties.

1.5 Accuracy

Individual observers differ in their subjective assessment of the various parameters recorded as part of the C.O.P.E. programme. Wave parameters such as type, height, and angle of approach together with surf zone width and location of the vegetation line all require visual assessment, the accuracy of this assessment will vary from observer to observer and possibly from recording to recording.

Although the Authority is confident that all observers make their observations to the best of their ability and accepts these observations without adjustment, the existence of random and non-random errors in the recorded data is to be expected.

Problems associated with the use of data containing these errors are minimised in two ways. Firstly, regular visits are made to the C.O.P.E. stations by the Authority's C.O.P.E. Field Officer to provide a check on any bias introduced into the recordings by incorrect observation procedures. Secondly, it has been found that, with a large number of observations taken on a regular basis, a reasonable assessment can be made of the average climatologies of the observed parameters provided the observation errors are random. A minimum recording period of three years has been adopted for the analysis and publication of the data. Five day moving averages are applied to observations of the various beach width and foreshore slope parameters to smooth out random errors.

For these reasons, the Authority is of the opinion that published C.O.P.E. data can be used with confidence provided the above inherent limitations are recognised.

1.6 Presentation of data

The purpose of this report is to present C.O.P.E. data for the eleven year period 1977 to 1988 in a useful statistical form. No attempt has been made to interpret the observed data.

If the eleven year period is representative of the long term average meteorological conditions, the statistics presented on wind, wave and beach movements can be regarded as typical. However, this recording period may be considered too short to be representative in terms of the average occurrence of extreme events such as cyclones and floods, and this should be taken into account when consideration is being given to the influence of such events on trends of long term beach behaviour.

2.0 Station particulars

2.1 Location

Point Vernon is a coastal headland located within the City of Hervey Bay and lies approximately 20 kilometres north east of Maryborough on the south Queensland coast. The station is situated on the beach adjacent to the camping reserve in the town of Pialba and is partly sheltered from the Pacific Ocean by Fraser Island. The station was established in conjunction with stations at Urangan and Torquay as part of the Hervey Bay Beaches Investigation. The location of the Point Vernon C.O.P.E. station is shown in Figure 1.1 and 1.2.

2.2 Observers

This station has been operated by Council employee Mr. G. Kruger (1977 - 1983) and Mr A. Brodie (1984 - 1988).

2.3 Supervision of station

The observers were instructed in the recording programme by the C.O.P.E. Field Officer and the initial instruction period was followed up with visits to the station during the period of recordings presented in this report.

2.4 Observed parameters

The observers at this station recorded the morning observation between 8am and 12pm and also recorded afternoon observations between 12.30pm and 6pm.

This station has recorded:

- Wave Period
- Wave Height
- Wave Direction
- Wave Type
- Surf Zone Width
- Presence of Offshore Bar
- Wind Speed
- Wind Direction
- State of Tide
- Longshore Current Speed
- Longshore Current Direction
- Distance from Shoreline to Dye Patch (recorded from January 1986)
- Monthly sand sample

2.5 Tidal information

Tidal information for Point Vernon as presented below.
Datum is Low Water Datum.

M.H.W.S.	3.11 metres
M.H.W.N.	2.52 metres
M.S.L.	1.87 metres
M.L.W.N.	1.24 metres
M.L.W.S.	0.62 metres

A.H.D. is 1.90 metres above Low Water Datum.

Tidal information was obtained from the 1991 Queensland Tide Tables.

2.6 Description of the beach

The beach at the Point Vernon C.O.P.E. Station exhibits the following characteristics:

- Typical beach slopes: Foreshore slope is in the range 1 in 8 to 1 in 10 (7° - 6°).
- Beach width: Varied from 20 to 30 metres measured from the seaward toe of the frontal dune to Low Water Mark over the eleven year period (1977 - 1988) as determined by regular aerial photography.
- D50 sand size: 0.36 mm averaged over eleven years (1977 - 1988).
- Adjoining Landform: Low and narrow frontal dune system backed by a levelled hind dune developed as a caravan and camping area.
- Vegetation: The frontal dune supports hermland dominated by sand spinifex grass *Spinifex sericeus* and goat's foot convolvulus *Ipomoea pes-caprae*. Other species present include saltwater couch *Sporobolus virginicus*, green couch *Cynodon dactylon* and young horsetail she-oaks *Casuarina equisetifolia* var. *incana*.

2.7 Meteorological events

The following cyclones were recorded by the Brisbane Bureau of Meteorology as having tracks within 500 kilometres of Point Vernon between March 1977 and November 1988. It is considered that these meteorological events may have had some effect on the condition of the beach at Point Vernon.

Cyclone Hal	04/05/78 - 12/05/78
Cyclone Gordon	09/01/79 - 11/01/79
Cyclone Kerry	13/02/79 - 05/03/79
Cyclone Paul	03/01/80 - 08/01/80
Cyclone Simon	20/02/80 - 28/02/80
Cyclone Cliff	09/02/81 - 15/02/81
Cyclone Abigail	22/01/82 - 05/02/82
Low Pressure System	03/06/83 - 06/06/83
Cyclone Ingrid	20/02/84 - 25/02/84
Cyclone Lance	04/04/84 - 07/04/84
Low Pressure System	07/04/84 - 13/04/84
Low Pressure System	18/05/84 - 23/05/84
Cyclone Pierre	18/02/85 - 24/02/85
Cyclone Vernon	21/01/86 - 24/01/86
Cyclone Blanch	21/05/87 - 27/05/87

3.0 Data

3.1 General

C.O.P.E. data for this station for the eleven year period March 1977 to November 1988 is presented on the attached figures. The data has been analysed statistically and/or smoothed to reveal long term averages or trends. A brief description of each of the observed parameters is given below with the relevant figure references.

3.2 Wind

The observer recorded the wind speed at the beach using a hand held wind meter at 1.5 metres above beach level. Prior to January 1986 wind direction was estimated to the nearest compass sector. After this time wind direction is recorded in degrees by compass.

A summary of annual wind speed and direction percentage occurrences are shown as a wind rose in Figure 3. Where applicable, morning and afternoon readings as well as the overall average are shown.

Wind speed was recorded in miles per hour (m.p.h.) rather than knots after January 1986. The recordings are converted from (m.p.h.) to knots for Figure 3.

3.3 Waves

The average and maximum breaker height (trough to crest) is usually estimated to the nearest 0.1 metre. From experience the estimate of average breaker height has been found to be comparable with the equivalent deep water significant wave height.

Recordings of maximum wave height and the new method used to obtain wave height were introduced into the programme from January 1986. Wave type and state of tide were discontinued at this time.

The observers estimate the wave period by recording the time taken for eleven wave crests (the duration of 10 waves) to pass a point.

Wave direction was recorded as a compass bearing from January 1986. The direction recorded was then converted to a sector (see the following paragraph regarding sector system).

The wave direction is estimated as one of five direction sectors indicating the angle to the shoreline alignment from which the waves are approaching the beach. These sectors have been selected as:-

Sector 1	-	0°	to	60°
Sector 2	-	61°	to	85°
Sector 3	-	86°	to	95°
Sector 4	-	96°	to	120°
Sector 5	-	121°	to	180°

Note: 0° is the beach alignment to the left of the observer when facing seaward, and at the COPE station this direction is approximately 80° west of true north.

Statistical representations of the observed wave data include:

- the percentage of wave height recordings which exceed any given wave height for all directions combined (Figure 4).
- the percentage occurrence of various combinations of wave heights and periods and directions (Figure 5 and Figure 6).
- surf zone width with an indication of the existence or otherwise of an offshore bar (Figure 7 to Figure 28).
- tabulation of the occurrence of various wave heights, periods, types and directions (Tables 1 to 12).

3.4 Longshore currents

The observer measured the distance parallel to the shoreline that a dye patch in the surf zone moved in one minute. Current direction is either upcoast or downcoast, upcoast being to the left when facing the sea from the beach.

3.5 Beach profile parameters

Beach profile parameters were not recorded at this station.

COASTAL OBSERVATION PROGRAMME - ENGINEERING

COPE

RECORD ALL DATA CAREFULLY AND LEGIBLY

SITE NUMBER	DAY	MONTH	YEAR	TIME	Record time using 24 hour system
1 2 3 4 5	6 7	8 9	10 11	<input type="checkbox"/> Summer Time <input type="checkbox"/> Standard Time	12 13 14 15
(i) WAVE HEIGHT (AVERAGE)				WAVE HEIGHT (MAXIMUM)	
Record the best estimate of the average breaking wave height to the nearest tenth of a metre. If less than 0.1 record as 0.0 and go directly to Section (ii).				16	17
				18	19
WAVE HEIGHT METHOD				WAVE PERIOD	
Record the method that you used to obtain wave height. Record 1 if visual estimate Record 2 if measured with COPE sticks Record 3 if measured by COPE pole				20	21 22 23
WAVE DIRECTION				SURF ZONE WIDTH	
Determine the direction that the waves are entering the surf zone using the compass provided and record the direction in degrees.				24 25 26	27 28 29
(ii) CURRENT SPEED				CURRENT DIRECTION	
Measure in metres the distance that the centre of the dye patch is observed to move during a one (1) minute period; if no long shore movement record 000.				30 31 32	33
DISTANCE FROM SHORE				OFFSHORE BAR	
Record the distance in metres from the shore to where the current measurements were commenced.				34 35	36
(iii) WIND SPEED				WIND DIRECTION	
Record wind speed to the nearest m.p.h. If calm record 00 and go directly to Section (iv).				37 38	39 40 41
(iv) FIXED CONTOUR ELEVATION				DISTANCE TO FIXED CONTOUR	
Record the elevation of the fixed contour.				42	44 45 46
				43	
(v) DISTANCE TO THE VEGETATION				SAND LEVEL AT POLE	
Record the distance from the reference post to the average vegetation line. Distances landward of the reference post are negative.				47 48 49	50 51
(vi) SAND SAMPLE				PLEASE PRINT	
If sample taken then record 1. Otherwise leave blank.				Please check the form for completeness

WAVE HEIGHT AND DIRECTION INSTRUCTIONS

METHOD 1 VISUAL ESTIMATION

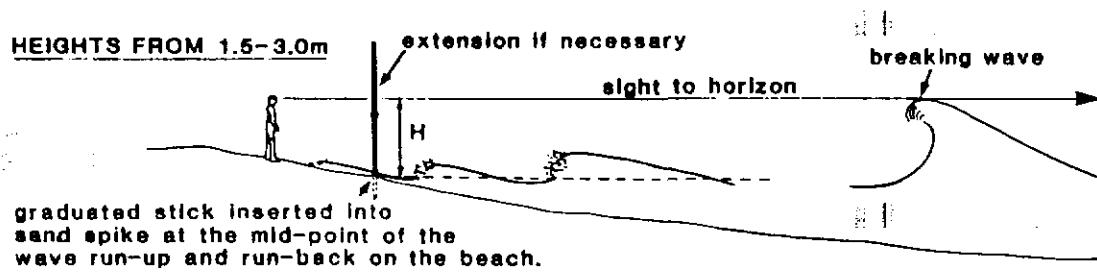

This method should only be used where the waveheights are below 0.5 and it is not practicable to use the preferred Method 2.

METHOD 2

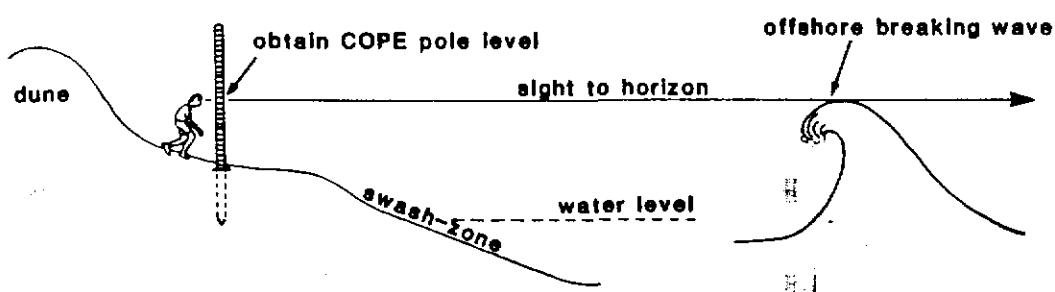

HEIGHTS FROM 0.5-1.5m

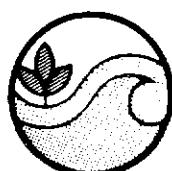

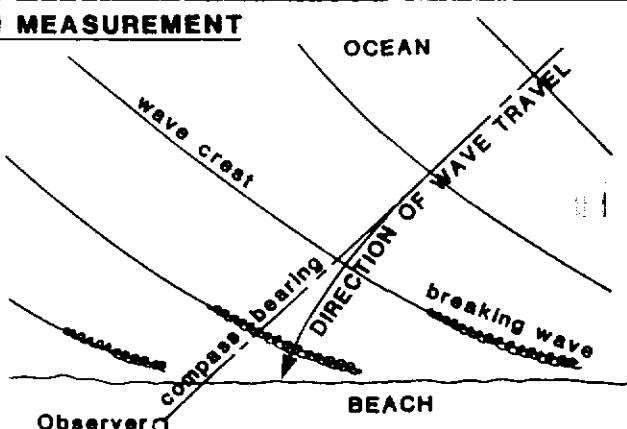

HEIGHTS FROM 1.5-3.0m

METHOD 3 FOR WAVES OVER 3m

WAVE DIRECTION MEASUREMENT

METHODS FOR RECORDING WAVE PARAMETERS
