

This Report was commissioned by Transport and Main Roads (TMR) for the purposes agreed between GHD and TMR as set out in section 1 of this Report. GHD otherwise disclaims responsibility to any person other than TMR arising in connection with this Report.

The services undertaken by GHD in connection with preparing this Report were limited to those specifically detailed in the Report and are subject to the scope limitations set out in the Report.

Our client TMR has advised that this Report may be used by delivering agencies (councils, facility owners and managers, port authorities and Transport and Main Roads) as one tool in a broader assessment process to choose and prioritise sites for development. The views expressed in this Report are not endorsed by Government or Cabinet policy positions. This Report should be used by the delivering agencies on an information only basis.

The opinions, conclusions and any recommendations in this Report are based on conditions encountered and information reviewed at the date of preparation of the Report. GHD has no responsibility or obligation to update this Report to account for events or changes occurring subsequent to the date that the Report was prepared.

The opinions, conclusions and any recommendations in this Report are based on limitations and assumptions made by GHD described in this Report. GHD disclaims liability arising from any of the assumptions being incorrect

Appendix B - Capacity assessment, existing facilities

Appendix C – Demand assessment (Economic Associates)

Definitions

'all-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for 100% of the tidal range

'ARI' means average recurrence interval, and refers to the average or expected time period between two occurrences of weather exceeding a certain magnitude

'capacity' means the ability to handle throughput for boat ramps, or the ability to handle multiple vessels at pontoons and floating walkways

'CHMP' means Cultural Heritage Management Plan

'CPM Reg' means the Coastal Protection and Management Regulation 2003

'CTU' means 'car-trailer unit', and applies to parking bays suitable for use by a tow vehicle with attached boat trailer

'DEE' means the Department of the Environment and Energy (Commonwealth)

'demand' means the current or projected requirement at a given year to service the needs of the recreational boating community – assuming full effectiveness of existing facilities and based on current numbers of registered recreational boats only. Excludes non-registered vessels such as canoes, kayaks, sail-boards, row boats, powered vessels not requiring registration, etc.

'effective capacity' for a boat ramp means the number of lanes for boat ramps after adjusting for usage constraints such as the lack of adequate parking or tidal accessibility, or improvements to efficiency such as floating walkways or pontoons, see section 4.1.1 for additional detail

'effective capacity' for a landing means the number of landings after adjusting for usage constraints caused by tidal and depth restrictions, see section 4.2.1 for additional detail

'DEHP' means the Department of Environment and Heritage Protection

'EPBC Act' means the Environment Protection and Biodiversity Conservation Act 1999 (Cwlth)

'FHA' means Fish Habitat Area

'GBR' means Great Barrier Reef

'IDAS' means Integrated Development Assessment System

'landings' means jetty and pontoon structures that facilitate direct berthing of non-trailable vessels (keel boats and >8.0m powerboats), transient vessels and/or tenders from larger vessels (where effective anchoring or mooring is available nearby)

'land-side' refers to infrastructure constructed above high water mark

'LGA' means local government area

'MCU' means a material change of use under the planning scheme

'MIIP' means the TMR works program known as the Marine Infrastructure Investment Program, with the government's Marine Infrastructure Fund forming its capital component

'MNES' means matter of national environmental significance under the EPBC Act

'NC Act' means the Nature Conservation Act 1992

'near all-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for at least 80% of the tidal range

'NNTT" means National Native Title Tribunal

'P Act' means the Planning Act 2016

'P Reg' means the Planning Regulation 2017

'part-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for at least 50% of the tidal range

'registration activation rate' means the percentage of registered vessels liable to be in use on any given good weather weekend day

'shd' means schedule

'shortfall' means the outstanding number of boat ramp lanes or landings as appropriate (assuming announced TMR projects/upgrades at December 2016 have been built) required to satisfy demand at a particular year, after adjustment for actual number and effective capacity considerations. A negative number for shortfall in a table signifies an oversupply

'SPL' means strategic port land

'Study' means this document including appendices and the state-wide summary

'TMR' means the Department of Transport and Main Roads

'water-side' refers to infrastructure constructed below high water mark

'WHA' means World Heritage Area

means 'number' when used in tables

Executive summary

This study sets out the current and future demand for publicly accessible recreational boating facilities within the Moreton Bay Regional Council area over the next 20 years. The assessment considers facilities for vessels, such as boat ramps and floating walkways, as well as landings for deep-draught vessels. It is intended to be used to inform funding priorities from 2018-19 onwards.

Key issues for Moreton Bay Regional Council

The primary issues raised by stakeholders around access to recreational boating facilities in the Moreton Bay Regional Council area centred on capacity and overcrowding.

Demand assessment

The demand assessment is based on boat registrations from within the local government area (LGA) of Moreton Bay and surrounding LGAs. The demand assessment is analysed against existing capacity to produce an outstanding shortfall projection. Key aspects influencing demand considered in the assessment include:

- The population of Moreton Bay Regional Council is projected to increase from 438,313 persons in 2016 to 627,462 persons in 2036, or by 1.8% per annum, very close to the five year projected state-wide average of 1.6% (Appendix C)
- Boat registrations are highest for boats up to 4.5 metres in length.
- Trailable and non-trailable vessel registrations within the Moreton Bay LGA are mostly
 used on the water within the LGA, with some leakage/export in usage from the LGA to
 Sunshine Coast Regional and Brisbane City Council areas.
- Vessel inflows from outside the LGA are likely from Sunshine Coast Regional Council,
 Brisbane City Council, Lockyer Valley Regional Council and Somerset Regional Council.
- The registration activation rate from residents of the LGA is anticipated to be low (7%) as a result of the status of Moreton Bay LGA as a metropolitan location.

Boat ramps

At present there are 23 boat ramp facilities in the LGA, containing 49 boat ramp lanes, however the lack of parking for car-trailer units (CTU) or limited tidal access at some locations means that the effective capacity of these ramps is 34.1 lanes. Once infrastructure planned for implementation by 2017-18 is in place (referred to as Marine Infrastructure Investment Program (MIIP) upgrades), this effective capacity increases to 35.3 lanes, generally because it is not accompanied by additional CTU parking.

To address any shortfall between demand and current capacity, existing facilities were further assessed to identify what type of access the facility provides to the two main destinations, being either open-water or non-open-water. This then allows identification of the type of additional facilities needed to address demand.

The projected boat ramp lane shortfall for Moreton Bay is shown in Table 1.

Table 1 - Projected boat ramp lane shortfall, Moreton Bay Regional Council

.Evaluation	ATTACTIVA	2016		2021		2026		2036	
category*		Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
Open- water access	27.3	20.7	-6.6	22.5	-4.9	24.6	-2.7	28.5	1.2
Non- open- water access	8	17.3	9.3	18.5	10.5	20.4	12.4	23.5	15.5
Total	35.3	38	2.7	41	5.7	45	9.7	52	16.7

^{*}Refer section 4.1.2 and Table 6 for detailed evaluation categories

Landings

The assessment of capacity and shortfall in landings is shown in Table 2 and Table 3.

Table 2 - Existing landing capacity, Moreton Bay Regional Council

Evaluation category	Existing effective capacity
# of public sheltered mainland landings*	3
# of public island landings – supplies available	0
# major private landings*	6
Total	9
Facilities not contributing to recreational capacity:	
# of public unsheltered mainland landings	0
# of public island landings – no supplies available	0

^{*}public sheltered mainland landings include Thurecht Parade pontoon and Bird O'Passage Parade jetty in Scarborough Boat Harbour, and the Bongaree jetty and twin pontoons

Table 3 - Projected landing shortfall, Moreton Bay Council

Evaluation	Existing effective	20		20		20		20	
category	effective capacity	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
# of landings*	9	7	-2	7	-2	8	-1	9	0

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

This assessment indicates that at present the public landings network in conjunction with the supplementary capacity provided by commercial or club landings is adequate to cater for existing demand.

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

^{*}See Appendix B and Table 6 for capacity assessment

^{*}private landings include marinas and clubs, accessible by fee for deep-draught vessels, and by arrangement, limited access for tender dinghies (varies with private entity, some free)

Recommended priorities

Refer to Table 4 for the Moreton Bay Regional Council area recommended priorities.

Recommended priorities to increase capacity and meet demand have been defined over the following time scales:

Priority 1 (P1) These sites are needed to meet existing demand.

Priority 2 (P2) Assuming that the priority 1 sites are implemented, these sites are expected to be needed to meet additional demand over the five years ending 2021.

Priority 3 (P3) Assuming that the priority 1 and 2 sites are implemented, these sites are expected to be needed to meet additional demand over the subsequent five years, that is 2021 to 2026.

Priority 4 (P4) These sites are those that will meet future demand, but are not expected to be required before 2026 in demand terms but may be brought forward for construction for other reasons.

Table 4 - Recommended priorities to increase capacity, Moreton Bay Regional Council area

Priority	Sites
Priority 1 (as soon as possible)	Marine Parade, Bellara – discontinue use of northern ramp by powered vessels, expand southern ramp to 5-lanes, and expand parking to 150 CTU spaces.
	Thurecht Parade, Scarborough Boat Harbour – expand the ramp to 4-lanes.
Priority 2 (over the next five years)	Dohles Rocks Road, Griffin – purchase freehold land to expand parking to 90 CTU spaces and widen ramp to 4-lanes with a floating walkway or wave protection structure.
Priority 3 (over the next five to ten years)	Pelican Park, Thomas Street, Clontarf – formalise parking to achieve 100 CTU spaces.
	Upstream and downstream ramps, Beachmere – expand parking to approximately 70 CTU spaces.
	New facility – Beachmere Road, Beachmere – 2-lane ramp with floating walkway and 45 CTU spaces.
Priority 4 (other)	New facility – Caboolture Marina – 4-lane ramp with a floating walkway and 90 CTU spaces.
	Uhlmann Road, Burpengary – Reclaim land and expand parking to 70 CTU spaces. Widen ramp to 3-lanes with a floating walkway.
	Freeman Road, Toorbul – expand parking to 45 CTU spaces.

1. Introduction

1.1 Background

GHD was commissioned by the Department of Transport and Main Roads (TMR) to establish the current and future demand for recreational boating facilities throughout Queensland. This resulting study is the *Recreational Boating Facilities Demand Forecasting Study 2017* (Study) and supersedes the 2011 study of similar name. The study replaces the *Recreational Boating Facilities Demand Forecasting Study 2016* by incorporating the results of the 2016 census.

The Study will be used to inform planning for the development of existing and new recreational boating facilities by a variety of agencies, including TMR, the Gold Coast Waterways Authority, local government, and port and water authorities. The Study is one tool in a broader assessment process to select and prioritise sites for development. Specifically, the Study is not binding in any way on the agencies it is designed to assist. The Study establishes demand and makes informed suggestions as to how the established demand might be addressed. The 2011 study, at December 2016, has had 66% of its recommendations adopted to a greater or lesser extent. A similar recommendation take-up rate may be expected from this Study.

This LGA report is one of a series of reports for the Study comprising LGA and state-wide components. The state-wide report details the Study background and provides an overview of demand for recreational boating facilities over the next 20 years throughout the state. The state-wide report complements individual reports for each local government area (LGA). Each LGA report identifies existing capacity, current and future demand, and potential opportunities for boating infrastructure within the LGA – with appropriate adjustment for interaction with adjacent LGAs.

1.2 Context

This LGA report has been prepared with a focus on in-water recreational facilities and infrastructure comprising boat ramps, floating walkways and landings within each LGA, which are publicly accessible by registered vessels. As car parking can significantly constrain the efficient use of a facility, it has been considered in the assessment. However, facilities used more than 50% of the time for commercial or public passenger transport (e.g. ferry terminals), private facilities (such as yacht clubs and marinas), and general recreational facilities such as canoe ramps and fishing platforms are not included as part of this study.

The types of infrastructure considered in the assessment of capacity are:

- boat ramps used for the launching and retrieval of vessels
- supporting infrastructure for the boat ramp:
 - queuing facilities (floating walkways, pontoons, queuing beaches)
 - parking for car-trailer units (CTUs)
- short-term landings accessible by deep-draught or non-trailable vessels on the outer face, or their tenders (for longer term tying up) on the inner/landward face or ends.

There may be instances where a public pontoon serves multiple purposes – as a short-term landing, as a tender tying up facility, and as a queuing facility for a boat ramp.

2. Local government area overview

The key characteristics and influences on recreational boating within the Moreton Bay Regional Council area include:

- The area is dominated by the key industries of manufacturing and agriculture, and is highly urbanised where associated with the greater Brisbane area.
- The population of Moreton Bay Regional Council is projected to increase from 438,313 persons in 2016 to 627,462 persons in 2036, or by 1.8% per annum, very close to the five year projected state-wide average of 1.6% (Appendix C)
- The area is part of the densely populated south-east Queensland region, and is considered to be a metropolitan LGA under the remoteness measures used by the Australian Bureau of Statistics.

3. Existing facilities

3.1 Overview of existing facilities

Within the Moreton Bay Regional Council area, existing recreational boating facilities are owned and managed by several organisations, shown in Table 5.

Table 5 - Recreational boating facilities within Moreton Bay Regional Council area

Infrastructure owner	Boat	ramps	Landings	
	Facilities	Lanes	Pontoons	Jetties
TMR (other than state boat harbour)	18	33	0	0
TMR (state boat harbour)	2	8	1	1
Moreton Bay Regional Council	3	7	0	1
Private landings (marinas/clubs)	N/A	N/A	6	0
Total	23	48	7	2

A map indicating the location of existing facilities is included as Appendix A.

Appendix B contains a summary capacity assessment of these existing facilities.

Important or popular public boat ramp facilities are located at:

- Scarborough Boat Harbour
- Marine Parade, Bellara
- Fifth Avenue, Bongaree
- Pelican Park, Thomas Street, Clontarf
- Saint Smith Road, Beachmere
- Dohles Rocks Road, Griffin.

Existing ramp facilities (including minor ones not mentioned above):

• service population centres including the Redcliffe Peninsula, Burpengary and the Pumicestone Passage area

 provide open-water access, or access to estuarine reaches of the numerous river and creek systems – some facilities providing access to both, such as Marine Parade in Bellara, Sandstone Point, Saint Smith Road in Beachmere and Uhlmann Road in Burpengary.

Research referenced in the previous demand assessment study (GHD, 2011).¹ indicated that boat owners were prepared to travel up to approximately one hour to reach major or preferred marine infrastructure. In many locations, this infrastructure is represented by facilities that provide all-tide, or near all-tide, open-water access.

Between the NSW border and Port Douglas, TMR has therefore adopted a long term strategy to seek to provide access to an all-tide, sheltered facility, within a one-hour drive time where practical. Exceptions to the strategy include where all-tide, sheltered access is not feasible. In these instances, sites that provide near all-tide sheltered access are sought instead.

Protected all-tide, open-water access is provided at the facilities at Scarborough Boat Harbour. The Harbour is within approximately a one-hour drive of main population areas. All-tide, open-water access is also provided at Bongaree, Sandstone Point and Spinnaker Marina, and Pelican Park in Clontarf.

The public deep-draught vessel landings within the LGA comprise:

- a pontoon and a jetty within Scarborough Boat Harbour, with the pontoon adjacent to the Thurecht Parade boat ramp and the jetty adjacent to the Bird O'Passage Parade boat ramp – the pontoon previously acting as a queuing structure for the Thurecht Parade ramp, with that demand now being met by a floating walkway
- a landing at Bongaree on Bribie Island, consisting of a central jetty with 2 pontoons accessible via shore-parallel gangways.

The pontoon adjacent to the Pelican Park facility in Clontarf is planned to be replaced by a floating walkway.

3.2 Key issues and hotspots

The primary issues raised by stakeholders around access to recreational boating facilities in the Moreton Bay Regional Council area are centred on capacity and overcrowding.

Overcrowding at certain facilities was raised by many stakeholders. Most of the overcrowding centred on popular facilities and those providing all-tide, open-water access, with Bongaree, Saint Smith Road in Beachmere and Uhlmann Road in Burpengary being the sites of main concern. Importantly, stakeholders identified that some of these facilities were not currently used to their full potential due to insufficient parking for CTUs.

Future crowding at Dohles Rocks Road in Griffin was identified as being of concern, as this facility is expected to increase in popularity due to nearby urban development.

4. Capacity assessment

4.1 Boat ramp capacity

The function of a boat ramp is to provide access for launching and retrieval of trailable vessels into a waterway. Alternative launching facilities such as boat stackers are outside scope for this Study.

¹ GHD (2011) Recreational Boating Facilities Demand Forecasting Study. Report prepared for TMR, September.

4.1.1 Boat ramp capacity evaluation

For the purposes of this Study, boat ramp capacity is measured as "effective" boat ramp lanes. An effective boat ramp is quantitatively characterised as being:

- capable of accommodating 40 launch / retrievals per lane per day (in accordance with Australian Standard AS 3962.2 and Economic Associates (2011).3)
- supported by landside infrastructure such as queuing and manoeuvring areas
- supported by an appropriate number of CTU parking spaces.

The number of launch / retrievals per lane per day has been selected based on the relevant Australian Standard and Economic Associates (2011)³. This latter report summarised research undertaken by SKM (1988).⁴ and Rose et. al (2009).⁵, and stated that a rate of 30 boats per lane per day is considered to provide unhampered overall amenity, whereas a rate of 50 boats per lane per day represents congested operations; thus a midpoint of 40 launches / retrieves per day was selected to represent a balanced scenario.

TMR (2016).6 provides guidance on its standard/reference number of CTU spaces to match boat ramp lanes:

- 90 CTUs for four-lane ramps
- 70 CTUs for three-lane ramps
- 45 CTUs for two-lane ramps
- 15 CTUs for one-lane ramps with sealed road access
- 10 CTUs for one-lane ramps with all-weather, unsealed road access.

The above figures indicate an average relationship of 22.5 CTU spaces per "effective" lane. The TMR reference standards differ from the number of CTU spaces recommended for public boat launching ramps by AS 3962. That standard requires between 20 and 60 CTU spaces per ramp lane, depending on whether the ramp is in an urban or rural area, whether it has a queuing structure, and whether it has separate rigging and de-rigging areas. For local reasons, TMR may vary from these reference figures in particular cases.

The actual capacity, or "effectiveness" of a boat ramp is unique for each ramp, and is affected by:

- a reduction in the amount of time a ramp is available for use due to tidal variability, the seaward extent of ramp infrastructure, and navigable depths at each ramp being measured as the % availability of the tidal range that a vessel can be realistically launched or retrieved with ramps classified as all-tide (100%), near all-tide (>80%), and part-tide (50%) for access and the reduction in availability occurring either:
 - at the ramp itself, and/or
 - in access channels connecting the ramp to the sea/open water (such as at a river mouth or other channel depth constraint)

⁵ Rose, T., Powell R., & Yu J. (2009) Identification of the Present and Future Recreational Boating Infrastructure in Redland City – A 10 year Infrastructure Plan, Griffith University

^{10 |} **GHD** | Report for Department of Transport and Main Roads - Queensland Recreational Boating Facilities Demand Forecasting Study 2017, 41/30098

- the exposure of the ramp to regular, and sometimes major, wave action these facilities tending to be beach ramps that are generally only suitable for short excursions in small boats in good weather and with suitable tides – accordingly these ramps are considered to be available only 50% of the time
- factors impacting efficient vessel launching and retrieval cycles, which include:
 - provision of queuing facilities such as pontoons, floating walkways or beaches with such queuing facilities increasing the capacity of a boat ramp by providing a place for a vessel to be secured during vehicle parking or retrieval without blocking a ramp lane, leading to greater throughput
 - constrained or difficult manoeuvring of vehicles and trailers onto the ramp
 - long distances between the boat ramp and CTU parking spaces
- the physical extent of infrastructure provided, such as:
 - the width and number of ramp lanes
 - the number of CTU parking spaces within the facility
 - provision for overflow parking during busy periods.

To calculate effective lanes at a boat ramp, the following adjustments have been applied to water-side infrastructure:

- all-tide no change (that is, multiplication factor of 1.0)
- near all-tide available 80% of the time (that is, multiplication factor of 0.8)
- part-tide available 50% of the time (that is, multiplication factor of 0.5)
- beach ramp available 50% of the time (that is, multiplication factor of 0.5)
- access to a queuing facility in the form of a floating walkway increase efficiency by 50% (that is, multiplication factor of 1.5)
- access to a queuing facility such as a gangway-access pontoon increase efficiency by 20% (that is, multiplication factor of 1.2).

Access to a beach, while convenient, is not suitable for all vessel sizes or preferred by some vessel owners, and therefore has not been considered to improve the capacity of a boat ramp.

As an example, the water-side effective lanes for a near all-tide, two-lane boat ramp with a floating walkway will be calculated as:

2	Х	0.8	Х	1.5	=	2.4
lanes		tidal		queuing		effective
		availability		structure		lanes

To calculate the land-side constraint on effective lanes, the following CTU groupings have been applied:

- 1 to 9 CTU 0.5 effective lanes
- 10 to 20 CTU 1 effective lane
- 21 to 29 CTU 1.5 effective lanes
- 30 to 39 CTU 1.8 effective lanes
- 40 to 54 CTU 2 effective lanes
- 55 to 64 CTU 2.5 effective lanes
- 65 to 75 CTU 3 effective lanes

- 76 to 83 CTU 3.5 effective lanes
- 84 to 97 CTU 4 effective lanes
- 98 to 105 CTU 4.5 effective lanes
- 106 to 117 CTU 5 effective lanes
- 118 to 127 CTU 5.5 effective lanes
- 128 to 140 CTU 6 effective lanes
- 141 to 149 CTU 6.5 effective lanes
- 150 to 157 CTU 7 effective lanes.

Unmarked or unformed parking areas are denoted accordingly. The number of CTU parking bays may also be the limiting factor on effective capacity, owing to the number of bays provided being less than the TMR reference standard.

The calculation is illustrated further in Appendix B, which details the actual and effective lanes for each facility.

The effective capacity of a facility is therefore limited by the constraining or "bottlenecking" element, and to realise full capacity a facility must balance the land-side and water-side capacities. The capacity assessment in Appendix B also identifies the limiting capacity constraint for each facility.

4.1.2 Boat ramp classification

As previously discussed, each boat ramp is subject to a unique set of constraints and opportunities, particularly in relation to tidal accessibility. To understand how well existing boat ramp facilities meet current demand, consideration has also been given to the recreational destination(s) accessed by each facility. Where available, this has been informed by local knowledge on actual usage.

Regardless of the tidal range available at the ramp itself, boat ramps typically seek to cater to one or more of the following destinations:

- access to the sea for fishing, diving, islands, jet skiing, and general recreation
- access to creeks and estuaries for fishing, crabbing, skiing and general recreation
- access to fresh water for fishing, skiing, jet skiing, and general recreation.

However, there are some practical limitations on the usage of a ramp for these purposes. These include:

- vessel size, as:
 - Small vessels are unsuitable for use in open and exposed waters under most conditions, although they may be taken into nearshore waters in calm conditions or for short journeys. These vessels are most suited to use in protected waterways such as creeks and estuaries.
 - Large vessels suited to offshore use may be physically constrained in very narrow or shallow waterways, such as the upstream reaches of creeks or estuaries.
- travel time to destination, as:

Although navigable access from a boat ramp to open water may be possible, it may not be practical due to the distance travelled by water and/or any speed restrictions that may be in place for the waterway. Most people will seek to launch at the facility that takes the least time to reach their destination. This is particularly the case for offshore destinations where larger volumes of fuel must be paid for and carried to allow for the journey.

Discussions with local government stakeholders throughout the state indicated that vessels longer than 4.5m were generally used to access offshore areas, with smaller vessels tending to be used for creek and estuary access. There will be circumstances where smaller vessels will be used to travel offshore and larger vessels will stay in protected waters.

At facilities where open-water access becomes difficult, the Study assumes that the facility will be more frequently used for accessing local creeks, estuaries, and freshwater areas. Facilities have therefore been classified into one of the following categories to reflect the primary level of accessibility between the ramp and open water:

- open-water access all-tide access
- depth-limited access to open-water possible but navigation limited at certain stages of the tide by water depth, for example, crossing a tidal bar, or sand shoals in an estuary
- distance-limited access to open-water possible but limited by longer travel times between the ramp and open-water, for example due to long distances, or speed restrictions in the waterway – with, in some instances, depth also being a limitation but distance being considered as the main constraint
- infrastructure-limited access limited by configuration or size or nature of the infrastructure, for example, a low bridge preventing navigation
- beach ramps
- no open-water access access to open-water is not possible or practical, for example, a
 facility in a dam, or on the upstream side of a weir, barrage, or waterfall.

4.1.3 Existing capacity

The existing boat ramp facilities have been assessed individually to quantify their "effective" lane capacity. This assessment is presented in Appendix B and summarised in Table 6.

TMR's Marine Infrastructure Investment Program (MIIP) – at December 2016 – sets out the infrastructure planned and funded for implementation until the end of the 2017-18 financial year, and includes the government's Marine Infrastructure Fund capital projects. Specific projects scheduled for implementation in the Moreton Bay Regional Council area under the MIIP that seek to increase the capacity of marine infrastructure comprise:

- expansion of ramp at Bellara to 4-lanes with a floating walkway
- replacement of pontoon with a new floating walkway at Pelican Park in Clontarf
- installation of a floating walkway or wave protection structure at Dohles Rocks Road facility in Griffin
- installation of a new floating walkway at Uhlmann Road facility in Burpengary.

The implementation of these upgrades informs the "effective" capacity in Appendix B. The summary in Table 6 shows (in brackets) the modified capacity following implementation of these projects.

Key observations drawn from this analysis include:

- Facilities in the Moreton Bay LGA tend to favour access to open-water over access into estuaries or river/creek systems.
- There are no freshwater facilities.
- Capacity at near all and all-tide facilities is generally constrained by the availability of sufficient CTU parking to fully support the water-side infrastructure already at the site.
- There are 47 actual lanes but only 34.1 effective lanes at present, reflecting limitations imposed by tidal restrictions and the lack of adequate parking. This is most evident for beach ramps, where there are currently five actual lanes but only two effective lanes.
- The MIIP (at December 2016) provides an increase in capacity in terms of effective lanes, predominantly due to the planned expansion of the Bellara facility from three to four lanes.

Table 6 - Summary of existing/planned* boat ramp effective capacity by access type, Moreton Bay Regional Council

Facility		# facilities	limited by						
accessibility and tidal availability at the ramp	# of facilities	Water-side infrastructure	Land-side infrastructure	Actual # of lanes	Effective lanes

^{*}Numbers in brackets include MIIP announced projects/upgrades as at December 2016

4.2 Landing capacity for deep-draught vessels

The function of most landings is to provide short-term shore access for deep-draught vessels to facilitate the transfer of passengers, provisions, or to make short excursions to the shore via tender dinghy. Landings may be located on the coast or in navigable river systems within the LGA, but are of little use unless sheltered from on-shore winds and wave action.

For this Study, landings include jetty and pontoon structures that facilitate direct berthing of non-trailable vessels (keel boats and >8.0m powerboats), transient vessels, and/or tenders from larger vessels (where effective anchoring, berthing, or mooring is available nearby).

4.2.1 Capacity evaluation

The measurement of the recreational capacity of a landing is complex, as it is affected by:

- exposure of the landing to wind and wave conditions
- size and condition of the landing
- tidal availability
- the length of stay permitted
- enforcement practices
- competition from non-recreational boating users (such as authorised commercial users).

To accommodate these factors, landing capacity has been considered in the context of each landing's:

- contribution to a network of public landings within the LGA, and within a day's sail of a landing outside the LGA
- proximity to existing private/commercial recreational boat landings that accommodate visitors (such as those provided by yacht clubs)
- ability to service key destinations, such as access to basic provisions, key population areas or recreational destinations
- proximity to existing anchorage or mooring areas
- anecdotal usage.

4.2.2 Existing capacity - deep-draught vessel landings

Within the Moreton Bay Regional Council area, there are three public landings that can be accessed by larger and deeper draught vessels for short-term stays (a couple of hours or less), as detailed in section 3.1.

Key observations indicate:

- The pontoon and the jetty within Scarborough Boat Harbour are accessible to deep-draught vessels. The pontoon is adjacent to the Thurecht Parade boat ramp and previously acted as a queuing structure for that ramp, however that demand is now met by a floating walkway. The jetty is approximately 90m south of the Bird O'Passage Parade ramp. The area surrounding the harbour is predominantly residential, with basic food provisions available approximately 1.8km away in central Scarborough. Larger shopping areas are several kilometres away in Redcliffe.
- The jetty/pontoons structure at Bongaree in Pumicestone Passage is accessible to deepdraught vessels. The structure consists of a jetty with two pontoons available via gangways that lie parallel to the shore. The structure provides access to central Bongaree, with shops, restaurants and basic food provisions available within close walking distance.
- The pontoon at Pelican Park in Clontarf is to be replaced with a floating walkway, as planned in the MIIP as at December 2016.

Although outside the scope of this study, key privately owned modern facilities within the LGA that also actively contribute to landing capacity include:

- Moreton Bay Boat Club and Scarborough Marina, both within Scarborough Boat Harbour and approximately 1.8km to shops with basic provisions
- Newport marina, located within Newport Waterways in Albatross Canal and just over 2km from shopping areas and food provisions
- Redcliffe Marina, which consists of pile moorings behind a detached breakwater in central Redcliffe
- Spinnaker Sound Marina, located opposite the Spinnaker Sound boat ramp facility in Pumicestone Passage and several kilometres from the nearest shops
- Pacific Harbour, which lies north of central Bellara in Pumicestone Passage, is accessed via Skippers Canal, and is several kilometres from the nearest shops.

The effective capacity of landings servicing the Moreton Bay LGA is summarised in Table 7.

Table 7 - Existing landing capacity, Moreton Bay Regional Council

Evaluation category	Existing effective capacity
# of public sheltered mainland landings	3
# of public island landings – supplies available	0
# major private landings	6
Total	9
Facilities not contributing to recreational capacity:	
# of public unsheltered mainland landings	0
# of public island landings – no supplies available	0

5. Demand assessment

The assessment of demand for recreational boating has been evaluated in terms of facilities for launching and retrieval of vessels (that is, boat ramps), and landings for short-term stays (generally less than a couple of hours). The demand for:

- boat ramps is driven by trailable vessels that can access the ramp
- landing facilities is focussed on providing a network of short term landings that service key land-side destinations (such as shops) of relevance or attraction to the boating community, with a particular focus on larger (non-trailable) vessels.

5.1 Boat ramp demand

The demand for boat ramps has been quantitatively evaluated using vessel registrations as the key indicator. The vessel registrations have been converted to an effective lane demand based on a typical boat ramp lane being able to accommodate 40 launch/retrieval manoeuvres per day.

The following section details the assessment of vessel registrations taking into consideration where vessels are likely to be used relative to where they are registered, and the demographics of the local area.

5.1.1 Registration distribution

People using the boat ramp facilities at a particular location are attracted to that facility by several factors, including:

- proximity to home
- road access (quality and distance)
- proximity to vessel destination (reef, open-water, islands, creeks, estuary, fishing grounds, skiing areas, and so on)
- quality of the experience and ease of use (launching/retrieval, parking, security, complementary facilities, and so on).

This means that at many locations and at various times, ramp users will travel out of the LGA in which their vessel is registered to use boat ramp facilities in a different LGA. In some locations, demand is driven by ramp users from outside of the LGA, particularly if the ramp is in reasonable proximity to desirable boating destinations such as fishing grounds or popular islands.

Additional detail on the determination of the registration distribution is provided in Appendix C. Note that vessel registrations are less in inland LGAs compared to adjacent coastal LGAs.

A summary of the relative geographic contribution of demand to boat ramp facilities located in the Moreton Bay Regional Council area is shown in Table 8 below for 2016 registration data.

5.1.2 Registration activation

TMR's approach to the provision of infrastructure for recreational boating is to aim to satisfy average demand rather than peak demand (TMR, 2016).

TMR recognises three levels of demand:

- off-peak demand to be met in almost all circumstances
- average demand taken to be demand for a facility on weekends (and for certain regional locations other busy periods)
- peak demand being demand for a facility at peak holiday periods and for special events such as major fishing competitions.

The qualifier on certain regions and circumstances for average demand recognises that in some areas high numbers of shift workers tend to distribute the demand more evenly across each week.

Provision is not made by TMR for peak boating periods such as Christmas, Easter, school holidays, and long weekends. For facilities provided by them, councils and port/water authority managers may choose to cater for higher than average demand.

Research referenced in the previous demand assessment study (GHD, 2011)⁸ indicated that average to high demand was represented by 8% to 14% of registered vessels seeking to use a boat ramp on a typical weekend. This percentage has been termed as "registration activation" for the purposes of this Study.

-

⁷ TMR (2016) Marine Facilities and Infrastructure Plan

⁸ GHD (2011) Recreational Boating Facilities Demand Forecasting Study. Report prepared for TMR, September.

To better represent the demand within each local government area, refinement of the registration activation percentage considered the following factors as influencing boating popularity over other recreational opportunities:

- incidence of blue collar employment (based on Census data)
- average age of residents (based on Census data)
- remoteness classification by local government area
- whether the LGA is coastal.

Detail on the process for local refinement of registration activation is provided in Appendix C. The adopted parameters for this assessment are summarised in Table 8.

Key observations relevant to the catchment activation include:

- a higher incidence of blue collar workers when compared to the state average outside the Moreton Bay LGA
- the status of all contributing catchments as metropolitan locations, with ready access to a wide range of other recreational activities.

Table 8 – Contribution to demand for boat ramp facilities, Moreton Bay Regional Council

Contributing LGA	% of contributing LGA using Moreton Bay facilities*	# of registered vessels from contributing LGA using Moreton Bay facilities	% registration activation	Contribution comment
Moreton Bay	80%	17,725	7%	Resident population Metropolitan
Brisbane	25%	2,937	6%	Visitation from adjacent coastal LGA Metropolitan
Lockyer Valley	10%	175	8%	Western catchment Older, blue collar, metropolitan, non-coastal
Somerset	10%	207	8%	Hinterland catchment Older, blue collar, metropolitan, non-coastal
Sunshine Coast	3%	504	6%	Visitation from adjacent coastal LGA Older, metropolitan

^{*}See Economic Associates Appendix C for percentage estimates

Key observations regarding boat ramp demand relevant to the contributions from the various sources are that:

- Population areas within the Moreton Bay LGA are largely located in close proximity to major highways (Bruce Highway, D'Aguilar Highway) or towards the coast (Redcliffe Peninsula, Deception Bay, Pumicestone Passage).
- Most (80%) Moreton Bay residents are considered to use facilities within the LGA. The remaining 20% are considered to use facilities in the Brisbane or Sunshine Coast LGAs.

- Some demand for tidal facilities from the inland LGA of Somerset is funnelled into the Moreton Bay LGA by virtue of the road network (D'Aguilar Highway).
- Demand for tidal facilities from the inland Lockyer Valley LGA is shared between other coastal south-east Queensland LGAs and Somerset LGA due to the road network and popular destinations within these Council areas.
- Several boat ramp facilities are close to the boundary between Moreton Bay LGA and the Brisbane City Council area, however these facilities are separated from Brisbane by rivers or creeks with few bridges. Sharing of demand between Moreton Bay and Brisbane LGAs is therefore expected to be relatively small.

5.1.3 Demand classifications

The demand by registered vessels has been sub-classified to better align with differing types of destinations:

- Smaller vessels (less than 4.5m in length) are considered to be generally used to access
 protected waters such as creeks and estuaries, and to venture into nearshore waters
 during good weather conditions.
- Larger vessels (between 4.5 and 8m in length) are considered to be generally used to
 access offshore waters, but seek protected waters during poor weather conditions.
 Depending on the location, some larger vessels are unable to use more tidally restricted
 facilities in creeks and estuaries.

5.1.4 Boat ramp lane demand

Applying the registration distribution and activation factors to vessel registration data results in an effective quantitative demand for boat ramp lanes within the catchment. This is summarised in Table 9, and shown in terms of small and large vessel demand. Assumptions used in the projections for future growth in demand are provided in Appendix C (Economic Associates report).

Table 9 - Boat ramp lane demand projections, Moreton Bay Regional Council

Vessel length	Boat ramp lanes						
	2016	2021	2026	2031	2036		
0 to 4.5m	28	30	33	36	38		
4.5 to 8m	10	11	12	13	14		
Total	38	41	45	49	52		

Key observations relevant to the catchment demand include:

- The majority of demand on facilities originates from Moreton Bay Regional Council residents.
- Demand from small boats is over twice that of larger boats.
- Growth is forecast to be relatively consistent over the next 20 years.

5.2 Deep-draught vessel landing demand

5.2.1 Local usage and network

Along with private marina facilities, the Bongaree jetty/pontoons and the Scarborough Boat Harbour pontoon and jetty form part of a network of mainland landings accessible by deep-draught vessels cruising the Queensland coast. Approaching from the south, it is approximately 18 nautical miles from the public landings in Manly Boat Harbour to Scarborough Boat Harbour, just over 7 nautical miles from Scarborough Boat Harbour to the landing at Bongaree, and approximately 32 nautical miles from the Bribie Island landing to the landing in Parkyn Parade, Mooloolaba. Alternatively, it is another 24 nautical miles from Bongaree to the Maloja Avenue pontoon at Caloundra, but access across the Caloundra Bar can be dependent on the sea state. Depending on the weather conditions and seasonal trade winds, both Manly and Mooloolaba are within a day's sail of Moreton Bay facilities.

Should visiting vessels decide to stay for more than one night they will need to seek an overnight protected berth or mooring. Commercial marina facilities cater to this demand, providing landing facilities for their members and for casual visitors. Moorings or berths are generally available at one of these private facilities.

The Bongaree jetty and pontoon structure is a popular landing for cruising vessels, both trailable and non-trailable, as it provides access to the town of Bongaree on Bribie Island. The jetty portion of the structure is a popular promenading deck, and the two pontoons are frequented by vessels on both faces, although access to the shoreward faces can be limited due to periodic sand build up. While the landing is popular during busy times, stakeholders have not indicated that the pontoons are overloaded in demand terms.

Scarborough Boat Harbour jetty is generally used by deep-draught vessels, while the pontoon is frequented by tenders which tend to tie up on the shoreward face of the pontoon, leaving the outward face free for larger vessels. While the harbour landings are not as popular as the Bongaree landing, they do provide access to marina facilities, restaurants and seafood suppliers. The popular Redcliffe area is just over 5km away, and there are regular bus services that leave from within 300m of the jetty.

5.2.2 Landing demand

The projected demand for deep-draught vessel landings within the Moreton Bay Regional Council area was assessed by Economic Associates as being driven by the size of the non-trailable fleet. A key difficulty with this assessment is understanding how long visits lasts. It was assumed that demand comprises 5% of the active non-trailable fleet seeking to access a landing. The assessment is shown in Table 10.

Table 10 - Landing demand projections, Moreton Bay Regional Council

Evaluation category			Landings		
	2016	2021	2026	2031	2036
# of landings	6	6	7	8	8

6. Development needs and opportunities

The need for additional recreational boating infrastructure within the Moreton Bay Regional Council area has been identified by comparing the existing capacity within the area with the expected demand.

6.1 Evaluation of needs

6.1.1 Development priorities

The priorities for development are linked to need and funding cycles, as follows:

- Priority 1 (P1) These sites are needed to meet existing demand.
- Priority 2 (P2) Assuming that the priority 1 sites are implemented, these sites are expected to be needed to meet additional demand over the five years ending 2021.
- Priority 3 (P3) Assuming that the priority 1 and 2 sites are implemented, these sites are expected to be needed to meet additional demand over the subsequent five years, that is 2021 to 2026.
- Priority 4 (P4) These sites are those that will meet future demand, but are not expected to be required before 2026 in demand terms but may be brought forward for construction for other reasons.

6.1.2 Quantification of shortfall - boat ramp lanes

The overall demand for boat ramp lanes compared to the effective capacity provided by existing facilities is summarised in Table 11.

Table 11 - Projected boat ramp lane shortfall, Moreton Bay Regional Council

Evaluation	Existing	20	16	20	21	20	26	20	36
category	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
All vessels, all facilities	35.3	38	2.7	41	5.7	45	9.7	52	16.7

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

However, the provision of additional boat ramp lanes needs to cater to the type of demand to appropriately address that demand. This realistically translates to:

- large (that is 4.5 to 8m) vessels seeking access to open-water
- small (that is <4.5m) vessels not seeking access to open-water.

As there will be some small vessels seeking access to open-water, and some larger vessels not seeking access to open-water, an envelope of projected need has been developed. The best estimate represents the average need within the envelope.

This analysis is shown in Table 12 for facilities classified as providing unhindered open-water access from all-tide or near all-tide facilities, with the envelope of projected need in the Moreton Bay LGA based on the following:

upper bound = 100% larger vessels + 50% smaller vessels

lower bound = 90% larger vessels + 30% smaller vessels

Table 12 - Projected boat ramp lane shortfall, open-water access facilities, Moreton Bay Regional Council

- Evaluation	Existing	20	16	202	21	20	26	20	36
category	effective capacity *	Demand *	Shortfall	Demand	Need	Demand	Shortfall	Demand	Shortfall
Best estimate	27.3	20.7	-6.6	22.5	-4.9	24.6	-2.7	28.5	1.2
Upper bound	27.3	24	-3.3	26	-1.3	28.5	1.2	33	5.7
Lower bound	27.3	17.4	-9.9	18.9	-8.4	20.7	-6.6	24	-3.3

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

The analysis was also conducted for facilities classified as not providing open-water access, or where water depth or the on-water travel time meant that the facility could not reliably or realistically provide access to open-water (see Table 13). In this analysis, the envelope of projected need in the Moreton Bay LGA was based on the following:

upper bound = 70% smaller vessels + 10% larger vessels

lower bound = 50% smaller vessels + 0% larger vessels

Table 13 – Projected boat ramp lane shortfall, non-open-water access facilities, Moreton Bay Regional Council

Evaluation	Existing	20	16	2021		2026		2036	
category	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
Best estimate	8	17.3	9.3	18.5	10.5	20.4	12.4	23.5	15.5
Upper bound	8	20.6	12.6	22.1	14.1	24.3	16.3	28	20
Lower bound	8	14	6	15	7	16.5	8.5	19	11

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

There will be some facilities that have been calculated as a "non-open-water access" facility that can, under some circumstances, provide open-water access. However, for the majority of users, access into the local waterway is the primary destination. This also applies to "open-water access" facilities in waterways, where some users will travel upstream into the waterway rather than going offshore.

^{*}Example of demand calculation: Upper bound 2016 - 100% of larger vessels (Table 9) + 50% of smaller vessels (Table 9) = 10 + 14 = 24

Given that the majority of demand is driven by Moreton Bay Regional Council residents, the location of additional or upgraded facilities should be targeted to service the population centres of and surrounding:

- the Redcliffe Peninsula
- Deception Bay, Burpengary and Griffin
- Caboolture and the Caboolture River
- Pumicestone Passage.

6.1.3 Quantification of shortfall - deep-draught vessel landings

The assessment of shortfall in landings is shown in Table 14. This assessment indicates that at present the public network in conjunction with the supplementary capacity provided by commercial or club landings is adequate to cater for existing and projected demand.

Table 14 - Projected landing shortfall, Moreton Bay Regional Council

Evaluation	Existing			2016 2021		2026		2036	
category	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
# of landings*	9	6	-3	7	-2	7	-2	8	-1

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

6.2 Identified stakeholder opportunities

Table 15 summarises the key facilities and sites identified by stakeholders during consultation activities as requiring consideration.

Table 15 - Stakeholder identified opportunities to increase capacity, Moreton Bay Regional Council

Facility	Stakeholder comments	Study comments
Upstream and downstream ramps, Beachmere	Popular, well-used facility. Good access to open-water and the Caboolture River. Parking is limited. Environmentally significant vegetation to the north.	Increase in CTU parking is recommended.
Kal-ma-kuta Drive, Sandstone Point	Excellent access to openwater and Pumicestone Passage. Parking is limited. Can be affected by wind and wave action.	The facility can be impacted by wind and wave conditions that may not support floating infrastructure and would therefore necessitate a breakwater type structure for protection. Parking expansion is limited and the facility is within 250m of a 4-lane boat ramp facility in a sheltered harbour. Upgrade to facility is not currently recommended.

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

Facility	Stakeholder comments	Study comments
Fifth Avenue, Bongaree	Popular, well-used facility. Excellent access to openwater and Pumicestone Passage. North ramp is more popular. Parking is highly limited. Increase in CTU parking desirable.	Parking expansion is highly constrained. Upgrade to facility not currently recommended.
Marine Parade, Bellara	Well-used facility. Excellent access to openwater and Pumicestone Passage. Options for facility expansion. Northern ramp has limited use – discontinued use of northern ramp is desirable.	Ramp expansion from 3 to 4-lanes planned in the MIIP as at December 2016. Discontinued use of northern ramp, further upgrade of southern ramp to increase ramp to 5-lanes, and parking expansion recommended.
Dohles Rocks Road, Griffin	Located close to future development area. Estuarine access. Parking is limited. Floating walkway is desirable.	A floating walkway or wave protection structure is planned in the MIIP as at December 2016. Acquisition of land for parking expansion and widening of ramp to 4-lanes (assuming floating walkway or wave protection structure is in place) is recommended.
Kal-ma-kuta Drive, Ningi (Spinnaker Sound Marina)	Popular, well-used facility. Excellent access to openwater and Pumicestone Passage. Parking is limited.	Parking expansion is highly limited and the facility is within 250m of a 2-lane facility. Upgrade to facility is not currently recommended.
Uhlmann Road, Burpengary	Popular, well-used facility. Good access to open-water and the Caboolture River. Parking is limited.	Floating walkway planned in the MIIP as at December 2016. Reclamation of land for parking expansion and widening of ramp to 3-lanes with floating walkway is recommended.
Freeman Road, Toorbul	Popular and well-used facility. Parking is highly limited. Small amount of reserve available for expansion. Expansion of parking desirable.	Acquisition of the land adjacent to the small area of reserve and conversion of this land into CTU parking to increase the facility capacity is recommended.
Grant Lane, Donnybrook	Estuarine access into Pumicestone Passage. Parking is highly limited. New facility location desirable.	Options for relocation to another location with sufficient water depth are limited. Options for parking expansion at current facility location are limited. Facility upgrade not currently recommended.

Facility	Stakeholder comments	Study comments
Pelican Park, Thomas Street, Clontarf	Popular, well-used facility. Excellent open-water access when maintained. Formalisation of parking is	Expansion of parking is recommended.
	desirable.	
Scarborough Boat Harbour	Well-used facilities. Excellent open-water access. Sufficient parking available at Thurecht Parade ramp for water-side expansion.	Expansion of Thurecht Parade facility to a 4-lane ramp with a floating walkway is recommended.

7. Development priorities

7.1 Methodology for selecting priorities

7.1.1 Boat ramp facilities

The selection of recommended works and their priority level has been considered on several levels. The first level of consideration for increasing boat ramp capacity is founded on two main criteria:

- type of access required open-water or non-open-water
- preference for expansion of existing facilities if suitably located.

Expansion of existing facilities is preferred over the establishment of new facilities in locations where travel times for most users to the existing facilities are not onerous, as road infrastructure for access is already in place and the foreshore is currently allocated to the purpose.

TMR's Marine Facilities and Infrastructure Plan (2016).9 also guides the prioritisation of boating facilities. This plan states that:

"The department favours proposals for boat launching and landing facilities that give access to the open sea at all tides.

Priority will be given to the provision of sheltered all-tide or near all-tide launching facilities giving access to the open sea on an all-tide or near all-tide basis.

Part-tide facilities (for launching or access) may be provided where there is demand, and dredged access is not feasible. For instance, beach access or open beach ramps may be provided where there is sufficient demand and no suitable nearby sheltered waterway." (Section 3.1.1 – Coastal locations – guideline).

"Access channels are not normally provided to open beach boat ramps. Beach access and open beach boat ramps are regarded as part-tide facilities." (Section 6.8 – Dredging of access channels to beach ramps – guideline).

The process used within each LGA identified opportunities to meet the need for ramp lanes for each type of access (open-water/non-open-water) at each of the priority time steps (2016, 2021, 2026 and 2036), is set out in the flowchart in Figure 1. Once the forecast shortfall for ramp lanes for a priority level has been met, further consideration of facilities falls to the next priority level until all forecast shortfall is met.

-

⁹ TMR (2016) Marine Facilities and Infrastructure Plan

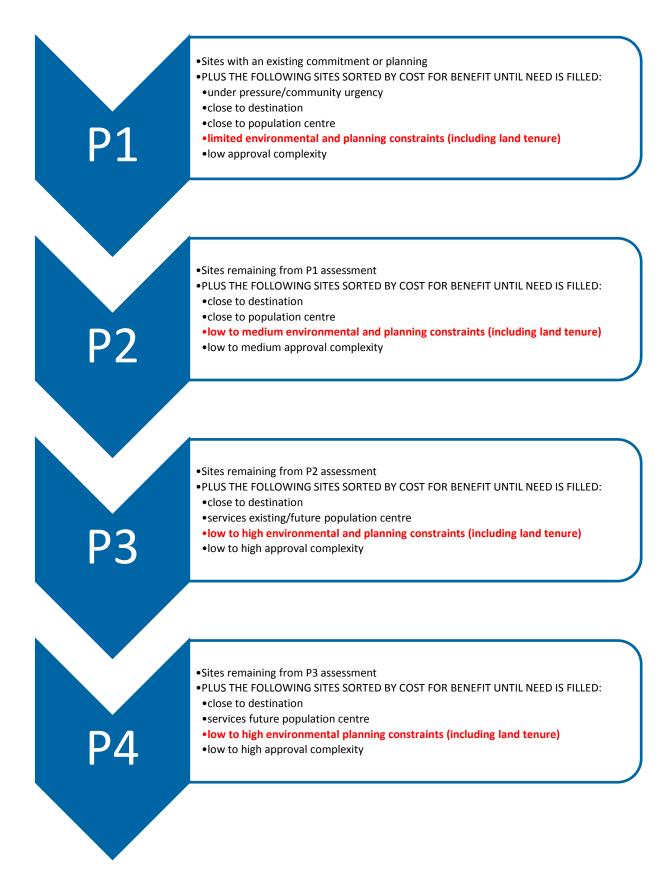

Figure 1 - Priority selection methodology

7.1.2 Deep-draught vessel landings

The criteria for recommended works and priorities for landings comprises:

- the geographical spread of existing facilities
- unserviced destinations and popular anchorages
- access to water of sufficient depth
- access to land-side services (shops or transportation) for mainland locations.

In some instances, deep water is not available and so provision for access by tenders or at higher tides is made.

In most instances where demand for additional landings is identified, there are very few locations that satisfy all needs. The prioritisation for these facilities is based on stakeholder perceptions of urgency. From a stakeholder perspective, the demand for landings is all current (that is, now). However, the recommendations have matched the timing of new landings to the demand forecast.

7.2 Recommended priorities

Table 16 - Recommended priorities to increase capacity, Moreton Bay Regional Council area

Priority	Sites
Priority 1 (as soon as possible)	Marine Parade, Bellara – discontinue use of northern ramp by powered vessels, expand southern ramp to 5-lanes, and expand parking to 150 CTU spaces.
	Thurecht Parade, Scarborough Boat Harbour – expand the ramp to 4-lanes.
Priority 2 (over the next five years)	Dohles Rocks Road, Griffin – purchase freehold land to expand parking to 90 CTU spaces and widen ramp to 4-lanes with a floating walkway or wave protection structure.
Priority 3 (over the next five to ten years)	Pelican Park, Thomas Street, Clontarf – formalise parking to achieve 100 CTU spaces.
	Upstream and downstream ramps, Beachmere – expand parking to approximately 70 CTU spaces.
	New facility – Beachmere Road, Beachmere – 2-lane ramp with floating walkway and 45 CTU spaces.
Priority 4 (other)	New facility – Caboolture Marina – 4-lane ramp with a floating walkway and 90 CTU spaces.
	Uhlmann Road, Burpengary – Reclaim land and expand parking to 70 CTU spaces. Widen ramp to 3-lanes with a floating walkway.
	Freeman Road, Toorbul – expand parking to 45 CTU spaces.

7.3 Capacity evaluation incorporating development priorities

The effective lane capacity has been reassessed to incorporate the delivery of the recommended development priorities as shown in Table 17, and described in detail in the following sections. The increase in effective lanes gained by each recommendation is shown in the relevant table for that recommendation.

Table 17 – Effective lane and landing capacity after delivery of recommended priorities, Moreton Bay Regional Council

		20	16	20	21	20	26	20	36
Evaluation category	Existing effective capacity*	Demand	Post- delivery effective capacity *	Demand	Post- delivery effective capacity	Demand	Post- delivery effective capacity	Demand	Post- delivery effective capacity
Open-water access	27	21	30	22.5	30	24.5	35	28.5	41
Non-open- water access	8	17	8	18.5	10.5	20.5	10.5	23.5	10.5
All vessels, all facilities	35	38	38	41	40.5	45	45.5	52	51.5
# of landings*	9	6	9	7	9	7	9	8	9

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

The post-delivery effective capacity number in Table 17 is calculated based on a facility's ability to provide open-water access. While some of the recommended facilities are classified as open-water access, the Bongaree, Bellara, Sandstone Point, Toorbul (Freeman Road), Beachmere and Uhlmann Road facilities also offer estuarine access, assisting in meeting the demand for estuarine facilities.

^{*}Effective capacities are reported to the nearest 0.5 of a lane

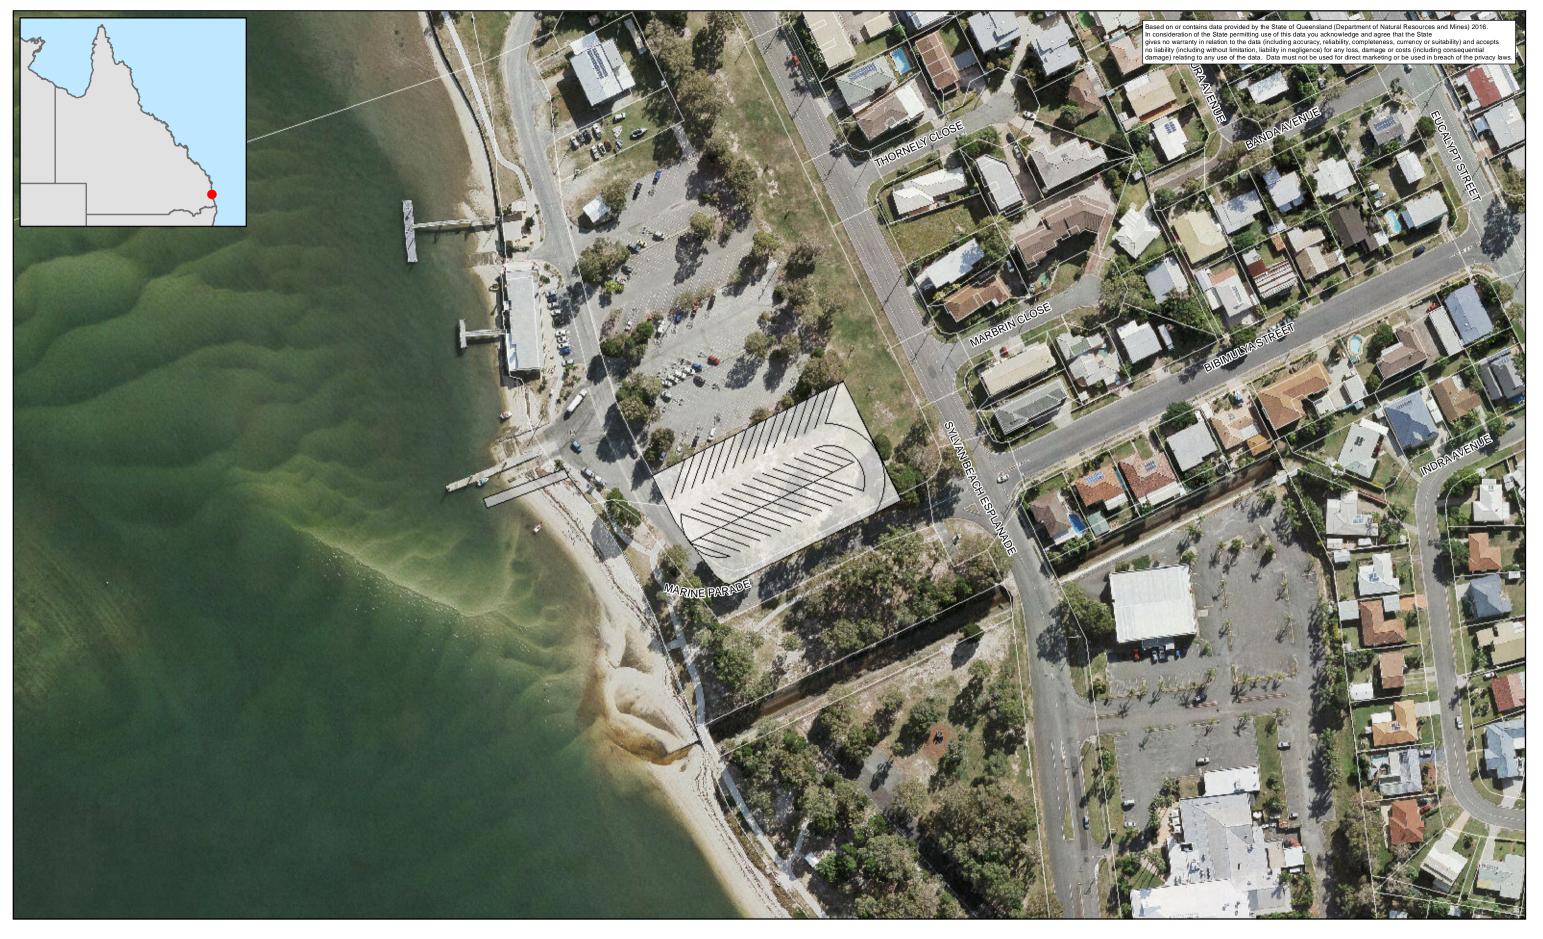

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

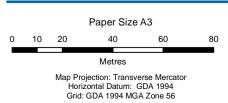

7.4 Priority 1 sites

Table 18 - Priority 1 - Marine Parade, Bellara

Site name	Marine Parade, Bellara
Existing formal facility?	Yes
Location	Marine Parade, Bellara
Current tidal status	All-tide, open-water access
Site characteristics	The Bellara facility is located on reserve land between Marine Parade and Sylvan Beach Esplanade in Bellara. The site is on the western shore of Bribie Island, approximately 560m north west of the Bribie Island Bridge, and provides direct access to Pumicestone Passage.
	The facility consists of two ramps, a 1-lane ramp to the north and a 3-lane ramp with a floating walkway to the south. The northern ramp is constrained by permanent structures on both sides, leaving no practical options for widening. The water-side area at the end of the northern ramp is also limited due to adjacent floating infrastructure. The southern ramp has a fourth lane planned as part of the MIIP as at December 2016.
	Bribie Island has several developments underway, which will generate an increase in future population.
Proposed works	Discontinue use of the northern ramp by powered vessels, expand the southern ramp to 5-lanes and extend the parking to achieve approximately 150 CTU spaces.
Increase in effective lanes provided by works	2 effective lanes
Rationale	The northern ramp currently is awkward to use from land-side and water-side perspectives. There is no opportunity to widen the ramp due to the proximity of permanent structures and users may have difficulty reversing through the narrow width available. The water-side area available for launch and retrieval is also limited due to private floating structures adjacent to the ramp. Discontinued use of the northern ramp by powered vessels and the addition of a lane to the southern ramp will preserve the water-side capacity of the facility and allow for more efficient use of the area. There is sufficient land-side and water-side area for facility expansion at the southern ramp. The land-side area in particular is reserve land for Local Government purposes. The facility provides access into Pumicestone Passage and Moreton Bay and services residents and visitors to Bribie Island, particularly residents from Banksia Beach, Bellara and Bongaree. The Bellara facility offers an alternative to the highly constrained but popular Bongaree facility, which is approximately 2.4km (1.3 nautical miles) upstream. Maintenance dredging is also planned as part of the MIIP as at December 2016.
Environmental and planning constraints	Native title claim under Kabi Kabi First Nation; NNTT QC2013/003. DATSIP Cultural Heritage Database search recommended. World Heritage, National Heritage place and nationally important wetland- Ramsar wetland – Moreton Bay and Bribie Island. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE. Marine plants - Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can

Site name	Marine Parade, Bellara				
	comply with the requirements u	under Shd 7 Item 8 of the P			
	Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).				
	Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in a year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1).				
	The works are located within the Moreton Bay Marine Park. A marine park permit may be required depending upon the works.				
	Located within the recreation and open space zone of the Moreton Bay Regional Council Planning Scheme. A 'landing' is self-assessable development in the recreation and open space zone. A 'utility installation' is exempt development in the recreation and open space zone.				
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg). Reserve tenure.				
Consultation feedback	Users of the ramp have indicated that they will often drive across the bridge to use the sheltered ramp within Spinnaker Sound Marina to avoid the cross currents at the Bellara ramp. If the cross currents are limiting the use of this ramp,				
	increasing the size of the car park may not be of benefit. It may be better to try and address the issue of the cross currents before increasing the car park.				
Indicative cost (excl. GST)	Water-based infrastructure	\$250,000			
(to ±50%)	Land-based infrastructure	\$1,080,000

Boating facility Marine Parade, Bellara

Table 19 - Priority 1 - Thurecht Parade, Scarborough Boat Harbour

Site name	Thurecht Parade, Scarborough Boat Harbour
Existing formal facility?	Yes
Location	Thurecht Parade, Western side of Scarborough Boat Harbour
Current tidal status	All-tide, open-water access
Site characteristics	Scarborough Boat Harbour is located on the northern side of Redcliffe Peninsula in southern Deception Bay, approximately 3.8km north of Redcliffe. The Harbour consists of two facilities, one on Bird O'Passage Parade and another on Thurecht Parade. The Thurecht Parade facility located on the western side of the harbour consists of a 3-lane ramp with a floating walkway and 120 CTU spaces. Scarborough Boat Harbour provides access into Moreton Bay via a maintained channel that is marked by navigation aids. It also houses the Redcliffe Coast Guard and has marina
	facilities available.
Proposed works	Expand the ramp to 4-lanes with a floating walkway.
Increase in effective lanes provided by works	1 effective lane
Rationale	The existing land-side infrastructure is sufficient to support an increase in the water-side infrastructure and will allow more efficient use of the facility.
	The Thurecht Parade facility is less constrained than the Bird O'Passage Parade facility in terms of available area, and is also located closer to the Harbour mouth, making it a more popular facility. The harbour provides protected, all-tide access into
	Deception and Moreton Bays via a marked, maintained channel.
Environmental and planning	Developed environment – impacts unlikely.
constraints	World Heritage, National Heritage place - Ramsar wetland – Moreton Bay. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE.
	Marine plants - Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg.
	Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).
	Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in a year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1).
	The works are located within the Moreton Bay Marine Park. A marine park permit may be required depending upon the works.
	Located within the industry zone of the Moreton Bay Regional Council Planning Scheme. A 'landing' triggers an impact assessable MCU application in the industry zone. A 'utility installation' is exempt development in the industry zone.

Site name	Thurecht Parade, Scarborough Boat Harbour	
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg). Freehold and lands lease tenures.	
Consultation feedback	None provided.	
Indicative cost (excl. GST) (to ±50%)	Water-based infrastructure	\$440,000
	Land-based infrastructure	\$ -

Boating facility Thurecht Parade, Scarborough State Boat Harbour

7.5 Priority 2 sites

Table 20 - Priority 2 - Dohles Rocks Road, Griffin

Site name	Dohles Rocks Road, Griffin
Existing formal facility?	Yes
Location	Dohles Rocks Road, Griffin
Current tidal status	All-tide, open-water access limited by other infrastructure
Site characteristics	The Dohles Rocks facility is located on the north bank of the Pine River at the eastern end of Dohles Rocks Road in Griffin. The site is approximately 2.7km (1.5 nautical miles) upstream of the Ted Smout Bridge (Houghton Highway). The height of the bridge can limit access into Bramble Bay, dependent on vessel size and tide. The existing facility consists of a 2-lane ramp with 23 CTU spaces. No boat queuing or wave protection structures are currently in place. Some form of wave protection is planned as part of the MIIP as at December 2016. This may be a groyne downstream of the ramp, or, if a wave climate study confirms feasibility for floating infrastructure, a heavy duty floating walkway. The facility is currently located on road reserve with limited area available for expansion without the acquisition of adjacent, privately owned land. The area is expected to continue to increase in population in the future due to housing developments in Griffin and surrounding suburbs.
Proposed works	Expand the ramp to 4-lanes with a floating walkway or wave protection structure and purchase land to expand parking to 90 CTU spaces.
Increase in effective lanes provided by works	2.5 effective lanes
Rationale	There are large scale future developments planned in the Griffin area, with potential for a large population increase in the southern suburbs of the Moreton Bay Regional Council area. The facility provides access into the Pine River with vessels potentially able to reach Bramble Bay, dependent on vessel size due to height restrictions at the Ted Smout Bridge. While land acquisition is required, there is potential for acquisition of only part of a lot. Given that a floating walkway is already planned under the MIIP, increased CTU parking must be provided at this site to realise a genuine increase in capacity. The parking recommended in this Study could be provided earlier and in stages to support the existing ramp with the floating walkway.
Environmental and planning constraints	World Heritage, National Heritage place and nationally important wetland - Ramsar wetland - Moreton Bay, Pine Rivers and Hayes Inlet. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE. Marine plants - Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg. Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development

Site name	Dohles Rocks Road, Griffin	
	under the P Reg Shd 7 Part 3, is undertaken by TMR. Accepted comply with the requirements of the Coastal Act, Section 167(5) Environmental Relevant Activities for dredging more that year may be triggered depending Part 5, Div 2, Item 1). FHA management area B is lown of the properties of the propert	ed development works are to for the work prescribed under (b)(b). y 16 extracting and screening an 1000 tonnes of material in a ng on works (P Reg Shd 10, cated within the site area. r partly in a declared fish elopment, unless the work is shd 7, part 3, section 7 of the P are Moreton Bay Marine Park. A nuired depending upon the tal management and ton Bay Regional Council iggers impact assessment in mpt from assessment against the works would be undertaken
Consultation feedback	The cost of land acquisition may upgrading the facility. As well as and parking, additional costs we reconstruction of the toilet block it is not ideal to have the main passing through the parking arbe stopping and reversing which it is suggested that further invested that further invested that further invested the particularly identify an alternative eastern end of Dohles Rocks is particularly as it appears as the the bank at this location.	as the cost for land acquisition yould also be incurred for k and picnic facilities. access road to the area ea, as cars with trailers may ch may cause traffic conflicts. estigation be undertaken to be location, such as at the Road at Korman Road,
Indicative cost (excl. GST) (to ±50%)	Water-based infrastructure (excluding floating walkway)	\$960,000
	Land-based infrastructure (excluding land acquisition costs)	\$2,650,000

Note that the floating walkway included in the Dohles Rocks Road, Griffin figure is indicative only. Some form of wave protection is planned as part of the MIIP as at December 2016. This may be a groyne downstream of the ramp, or, if a wave climate study confirms feasibility for floating infrastructure, a heavy duty floating walkway.

Boating facility Dohles Rocks Road, Griffin

7.6 Priority 3 sites

Table 21 - Priority 3 - Pelican Park, Thomas Street, Clontarf

Site name	Pelican Park, Thomas Street, C	Clontarf				
Existing formal facility?	Yes					
Location	Pelican Park, at the intersection Hornibrook Esplanade, Clontar					
Current tidal status	All-tide, sheltered open-water a	access				
Site characteristics	The Pelican Park facility is located at the southern end of Thomas Street on Hornibrook Esplanade, at Clontarf Beach at the southern end of the Redcliffe Peninsula. The site is approximately 800m north-east of the Ted Smout Bridge (Houghton Highway) and Hays Inlet. The facility is bordered by a popular park area to the west and a creek to the east. The existing facility consists of a 4-lane ramp with an adjacent pontoon and 63 marked CTU spaces, however the pontoon is planned to be replaced by a floating walkway as part of the MIIP as at December 2016. Currently, an unformed parking area is available for overflow parking. An area around the ramp has recently been dredged.					
Proposed works	Formalise CTU parking to achie	eve a further 32 CTU spaces.				
Increase in effective lanes provided by works	2 effective lanes					
Rationale	Formalisation of the unformed parking will allow more efficient use of the area, particularly during busy times. Expansion of land-side infrastructure will also assist in increasing efficient usage of the existing water-side infrastructure. A small breakwater provides some protection from southeasterly wind and wave action.					
Environmental and planning constraints	Developed environment – impacts unlikely. World Heritage, National Heritage place - Ramsar wetland - Moreton Bay. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE. Impacts unlikely. Located within the recreation and open space zone of the Moreton Bay Regional Council Planning Scheme. A 'utility installation' is exempt development in the recreation and open space zone. The operational works are exempt from assessment against the local planning scheme as the works would be undertaked by or on behalf of a public sector entity (TMR) (Shd 6 Part 3 Section 8 of P Reg). Reserve tenure.					
Consultation feedback	Formalisation and expansion o	f parking at the Pelican Park				
Indicative cost (aval. CCT)	facility is generally supported.					
Indicative cost (excl. GST) (to ±50%)	Water-based infrastructure \$ - Land-based infrastructure \$450,000

State controlled road

Table 22 - Priority 3 - Saint Smith Road, Beachmere

Site name	Saint Smith Road, Beachmere
Existing formal facility?	Yes
Location	The end of Saint Smith Road, Beachmere
Current tidal status	Near all-tide, open-water access
Site characteristics	The Beachmere (upstream and downstream ramps) facility is located on the eastern bank of the Caboolture River at the end of Saint Smith Road in Beachmere. The site is approximately 2.2km (1.2 nautical miles) upstream of the river mouth. The existing facility consists of two ramps, the downstream ramp with 2-lanes and the upstream ramp with 2-lanes and a floating walkway. The two ramps share a parking area with a total of 31 CTU spaces available. The site lies on a section of road reserve, with the upstream ramp and a section of the parking area located on freehold land. This freehold land is low-lying with environmentally significant vegetation extending from the border of the
	parking area to the north. The land to the south of the facility is also vegetated freehold land but is at a higher elevation.
Proposed works	Expand the parking on the southern border of the existing facility along the road edge to increase the parking to approximately 70 CTU spaces.
Increase in effective lanes provided by works	1 effective lane
Rationale	Expansion of parking will increase the efficient use of the existing infrastructure, as the capacity of the facility is currently heavily constrained by the available parking. Expansion of the facility along the southern border of the facility and road will allow the preservation of the environmentally significant vegetation to the north.
Environmental and planning constraints	World Heritage, National Heritage place - Ramsar wetland – Moreton Bay. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE.
	Category B remnant vegetation mapped over site, being least concern RE 12.2.5. Exemptions apply for clearing native vegetation on land generally that is clearing for the construction or maintenance of community infrastructure mentioned in Shd 21, Part 1, Section 14 (b) of P Reg that is government supported transport infrastructure.
	Marine plants may be present within the site. Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg.
	FHA management area A is located within the site. Operational work completely or partly in a declared fish habitat area is assessable development, unless the work is accepted development under shd 7, part 3, section 7 of the P Reg.
	Located within the road reserve and the adjacent zoning is environmental management and conservation zone of the Moreton Bay Regional Council Planning Scheme. The work trigger impact assessment in the environmental management and conservation zone.
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken

Site name	Saint Smith Road, Beachmere		
	by or on behalf of a public sect Section 8 of P Reg). Limited development zone may Road reserve and freehold ten	y be impacted.	
Consultation feedback	Additional parking may not be required at this location. It is recommended that inspections be undertaken during busy times to determine if extra parking is needed.		
	It is also noted that while the recommendation minimises intrusion into environmentally sensitive areas, some of the new bays are a long way from the ramps.		
	Consideration should be given to restricting fishing from the floating walkway, as there has previously been conflicts between fishermen and boat users.		
Indicative cost (excl. GST)	Water-based infrastructure	\$ -	
(to ±50%)	Land-based infrastructure	\$640,000

15 Dec 2016

Boating facility Saint Smith Road, Beachmere

Table 23 - Priority 3 - Beachmere Road, Beachmere

Site name	Beachmere Road, Beachmere
Existing formal facility?	No
Location	Beachmere road, 400m south of Riversleigh Road, Beachmere
Current tidal status	Near all-tide, open-water access
Site characteristics	The site is located on the northern bank of the Caboolture River, on Beachmere Road in Beachmere approximately 400m south of Riversleigh Road. It is approximately 9.3km (5 nautical miles) upstream of the existing Beachmere facility and approximately 6.5km east of Caboolture.
	The site provides access to the upper estuarine reaches of the Caboolture River, however there is still the opportunity to access open-water downstream into Moreton Bay.
	The river bank in the area is prone to erosion, with the areas not colonised by vegetation showing signs of significant bank loss.
	The site is located on road reserve and currently offers access to an adjacent property. The river bank is also fenced off to discourage public access due to the bank erosion.
Proposed works	Construct a 2-lane ramp with a floating walkway and formalise parking area to achieve 45 CTU spaces.
	Bank protection works are required along the edge of the facility. The extents of riverbank protection may extend beyond the borders of the facility and requires further investigation.
Increase in effective lanes provided by works	2 effective lanes
Rationale	The site provides an estuarine access point on the north bank of the Caboolture River, creating an alternative to the existing Beachmere facility for users accessing upstream waters.
	The land is located on road reserve with sufficient land-side and water-side area to support a 2-lane facility, however access to the adjacent property may require relocation.
	Formalisation of a facility would support complimentary bank protection measures to reduce ongoing erosion in that area of the river bank.
Environmental and planning constraints	World Heritage, National Heritage place - Ramsar wetland – Moreton Bay. If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE.
	Marine plants may be present within the site. Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg.
	Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).
	FHA management area A is located within the site area. Operational work completely or partly in a declared fish habitat area is assessable development, unless the work is

Site name	Beachmere Road, Beachmere				
Site Harrie	accepted development under shd 7, part 3, section 7 of the Reg. Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1). Site is opposite State Heritage place – Morayfield Plantation 1/SP266287. Located within the road reserve and the adjacent zoning is rural zone and limited development zone of the Moreton Bar Regional Council Planning Scheme. The works trigger an impact assessable MCU application in the limited development zone and are exempt in the rural zone. The operational works are exempt from assessment against the local planning scheme as the works would be undertaked by or on behalf of a public sector entity (TMR) (Shd 6 Part 3 Section 8 of P Reg).				
Consultation feedback	Road reserve. It is recommended that investig determine if there is actually deincluding community consultati Locations of future development on the southern bank of the riversacility on the northern bank. It boat users would seek to trave River with most seeking to gair Driving further downstream to I would likely be preferable. With this section of Beachmere speed limit, turning lanes and list support the proposed new turn with re-alignment of the private	emand at this location, on. Ints may favour a new facility er, rather than an additional is also suggested that few I upstream in the Caboolture access to Moreton Bay. aunch near the river mouth e Road having a 100km/h ighting would be required to out to the carpark together

Boating facility Caboolture Marina

Table 25 - Priority 4 - Uhlmann Road, Burpengary

Site name	Uhlmann Road, Burpengary
Existing formal facility?	Yes
Location	At the eastern end of Uhlman Road, Burpengary
Current tidal status	Near all-tide, open-water access
Proposed works	Reclaim land to the south, extend parking into reclaimed area to achieve 70 CTU spaces and expand ramp to 3-lanes with a floating walkway.
Increase in effective lanes provided by works	1.5 effective lanes
Rationale	Expansion of the parking will support more efficient use of the existing water-side infrastructure. The area to the south of the facility has not been colonised by marine plants, suggesting that the area is not regularly inundated and could potentially be reclaimed. The Uhlmann Road facility offers access to the Caboolture river from the western bank, servicing Burpengary and the surrounding suburbs.

1 INTRODUCTION

1.1 Purpose of study

Economic Associates (as a sub consultant to GHD Pty Ltd) were engaged by the Department of Transport and Main Roads (TMR) to undertake an assessment of the demand for recreational boating facilities at the local government area (LGA) level. Demand projections have been prepared at five year intervals to 2036 (that is, 2016, 2021, 2026, 2031 and 2036) and take into account current and future demand for recreational boat ramps and landings.

This study represents an update to the Recreational Boating Facilities Demand Forecasting Study 2016, taking into account 2016 Census data.

1.2 Report structure

The report has been structured as follows:

- Section 1: Introduction: Provides an outline of the purpose of the study and report structure
- Section 2: Projected size of recreational boating fleet: Provides an overview of the assumptions utilised in preparing estimates of the projected recreational boating fleet by LGA
- Section 3: Infrastructure demand assessment: Provides an overview of the assumptions
 utilised in preparing estimates of the demand for new or upgraded boat ramps and landings by
 LGA
- Section 4: References: Provides a summary of the references utilised in preparing this report.

1.3 Disclaimer

This report is based on the most up to date readily available information. Sources are documented in the report. Economic Associates has applied due professional care and diligence in accordance with generally accepted standards of professional practice in undertaking analysis and interpretation of source information. Economic Associates is not liable for damages arising from any errors or omissions arising from use of these information sources.

As this report involves future projections which can be affected by a number of unforeseen circumstances, it represent our best possible estimates and no warranty is given that these particular projections will eventuate.

2 PROJECTED SIZE OF RECREATIONAL BOATING FLEET

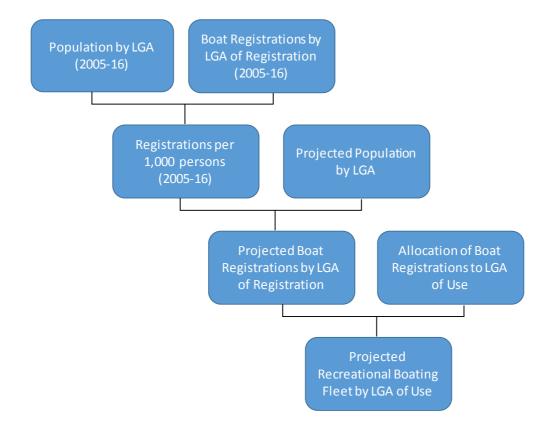

This section of the report provides a summary of the projected size of the recreational boating fleet by LGA, including a detailed explanation relating to the assumptions made in preparing the projections.

2.1 Methodology

In estimating the projected size of the recreational boating fleet, the assessment has made a number of assumptions relating to the current and projected size of the trailable and non-trailable fleet and the relationship between LGA of registration and LGA of waterway/facility use.

Figure 2.1 below outlines the methodology utilised in preparing the projected size of the recreational boating fleet by LGA of use.

Figure 2.1: Methodology utilised in projecting recreational boating fleet by LGA of use

2.2 Assumptions

2.2.1 Current size of recreational boating fleet

TMR provided data relating to historical boat registrations for the 2005 to 2016 period for the following categories:

- · sail boats
- boats without sails, including:
 - motor boats without sails
 - speed boats
 - jet skis (or personal watercraft).

The data was provided by LGA of registration. This data was used to generate historical estimates of the size of the trailable and non-trailable boat fleet for each LGA, including the following sub-categories:

- trailable fleet, which comprises the following sub-categories:
 - boats up to 4.5 metres in length (including jet skis)
 - boats 4.5 8 metres in length
- non-trailable fleet (vessels most likely to be berthed at marinas or private moorings).

The trailable boat fleet has been estimated for two sub-classes to identify vessels that tend to be used inshore (vessels up to 4.5 metres in length) versus vessels which have the ability to travel offshore (vessels 4.5 – 8 metres in length). The 4.5 metre cut-off length was identified through consultation with LGA and port/water storage officers undertaken by GHD as part of this study, and confirmed by TMR officers as being reasonable and accepted for intended uses of the study.

Table 2.1 below summarises our assumptions in relation to the split of trailable boats and non-trailable boats based on the data provided by TMR. This assessment assumes that all boats greater than eight metres in length are non-trailable and that all jet skis are within the trailable boat fleet.

The incidence of trailable and non-trailable boats eight metres or less in length is consistent with the assumptions made in the Recreational Boating Facilities Demand Forecasting Study 2011.

Table 2.1: Estimated proportion of trailable and non-trailable boats, 2005-2016

Length	Trailable		Non-trailable		
	sail boats	Boats without sail	Sail boats	Boats without sail

Source: Economic Associates estimates

In 2016, there were 996 vessel registrations that were not assigned to an LGA in Queensland¹, comprising 983 interstate registrations, five overseas registrations and eight unknown registrations. For this assessment, the following assumptions have been made for the allocation of these registrations to the trailable and non-trailable boat fleets:

- Interstate registrations: Interstate registrations have been allocated in the manner outlined in Table 2.1 above, as it is considered likely that the majority of interstate registrations of a trailable length are within northern NSW.
- Overseas and unknown registrations: The assessment has assumed that all overseas and unknown registrations are of a non-trailable nature.

Based on the assumptions presented in Table 2.1 above and the allocation of interstate, overseas and unknown registrations, the estimated size of the recreational boating fleet in Queensland was 279,586 vessels in 2016, comprising:

- 184,835 trailable boats up to 4.5 metres in length (including jet skis)
- 73,462 trailable boats 4.5 8 metres in length
- 21,289 non-trailable boats.

Not surprisingly, the size of the recreational boating fleet was highest in a number of South-east Queensland councils, Mackay Regional Council, Townsville City Council, and Cairns Regional Council.

Table 2.2 below presents the estimated size of the recreational boating fleet in Queensland and each of the component LGAs in 2016.

Table 2.2: Estimated size of recreational boating fleet by LGA, Queensland, 2016

2.2.2 Historical incidence of boat ownership

To determine the projected number of boat registrations in each LGA, the boat registration data, in conjunction with historical population data, has been analysed to calculate the historical incidence of boat ownership (that is, the number of boat registrations per 1,000 persons). The historical incidence of boat ownership was calculated for the trailable and non-trailable fleets, as defined in Section 2.1.1 above.

In the 2005 to 2016 period, the average incidence of boat ownership was as follows:

- trailable boats up to 4.5 metres in length (including jet skis): 0.00 140.93 boats/1,000 persons
- trailable boats 4.5 8 metres in length: 0.26 81.45 boats 1,000 persons
- non-trailable boats: 0.00 22.39 boats/1,000 persons.

The historical incidence of boat ownership is highest in coastal communities such as Hinchinbrook Shire, Burdekin Shire, Cook Shire, Douglas Shire, Cassowary Coast, Livingstone Shire, Town of Weipa, and Whitsunday. Of these coastal communities, only Cook Shire recorded a decline in the incidence of boat ownership between 2005 and 2016.

Table 2.3 below summarises the average historical incidence of boat ownership by vessel class in the 2005 to 2016 period, by LGA.

Table 2.3: Historical incidence of boat ownership (registrations / 1,000 persons) by LGA, 2005-2016

Note: Decrease - a decline in the incidence of boat ownership per 1,000 persons between 2005 and 2016, Increase - an increase in the incidence of boat ownership per 1,000 persons between 2005 and 2016. Source: Economic Associates estimates based on data provided by TMR

2.2.3 Projected population by LGA

To project boat registrations by LGA, this analysis assumes that the incidence of new boat registrations post 2016 is consistent with the 2005-2016 average (as outlined in Table 2.3 above).

The assessment has relied on the latest projections prepared by the Queensland Government Statistician's office (Queensland Government 2015, Population Projections by LGA, medium series), rebased to take into consideration the 2016 population estimates published by the Australian Bureau of Statistics (released subsequent to the 2016 Census of Population and Housing).

Table 2.4 below outlines the projected population of each LGA in Queensland.

2.3 Projected size of recreational boating fleet

2.3.1 Projected size of fleet by LGA of registration

Based on the assumptions outlined above, the projected size of the recreational boating fleet registered in Queensland is projected to increase from 279,586 boats in 2016 to 381,988 boats in 2036, with the composition in 2036 anticipated to be as follows:

- 251,600 trailable boats up to 4.5 metres in length
- 100,795 trailable boats 4.5 8 metres in length
- 29,594 non-trailable boats.

Growth in the number of registrations is anticipated to be highest in a number of South-east Queensland councils, Cairns Regional Council, Townsville City Council and Mackay Regional Council.

Table 2.5 below summarises the projected size of the recreational boating fleet in Queensland by LGA of registration, between 2016 and 2036.

2.3.2 Allocation of recreational boating fleet to LGA of use

The projected recreational boating fleet estimates presented in Table 2.4 above outline the projected number of boat registrations in each LGA in Queensland, that is, the number of boat registrations by place of residence. However, boat owners may utilise their boat in multiple LGAs, including LGAs other than their place of residence.

In allocating boat registrations to LGA of use, the assessment undertook a review of the distribution of boating infrastructure throughout Queensland and was informed by consultation with LGA and port/water storage officers undertaken by GHD as part of this project.

Two matrices were compiled which outline the distribution of boat registrations to the relevant LGA/s of use, one for trailable boat registrations and the other for non-trailable boat registrations. These two matrices are presented in Appendix A.

In the case of trailable boat registrations, allocations were made only to those LGAs with identified public boating infrastructure. Based on information provided by GHD, the following LGAs in Table 2.6 did not appear to have any public boating infrastructure, and hence were not allocated any boat registrations for use in that LGA.

2.3.3 Projected size of fleet by LGA of use

Based on 2016 data, the size of the recreational boating fleet in Queensland is projected to increase from 272,472 boats in 2016 to 371,328 boats in 2036. The size of the recreational boating fleet in Queensland is approximately 3% lower than total boats registered in Queensland

as a result of vessel registration leakage, predominantly from the Gold Coast to northern New South Wales.

A number of LGAs are anticipated to record significant registration inflows, including:

- Redland City Council (net inflow of 8,740 vessels in 2016, increasing to 14,247 vessels in 2036)
- Gold Coast City Council (net inflow of 4,594 vessels in 2016, increasing to 7,844 vessels in 2036)
- Somerset Regional Council (net inflow of 3,075 vessels in 2016, increasing to 3,697 vessels in 2036)
- Sunshine Coast Regional Council (net inflow of 1,966 vessels in 2016, increasing to 2,314 vessels in 2036)
- Hinchinbrook Shire Council (net inflow of 1,894 vessels in 2016, increasing to 2,858 vessels in 2036)
- Scenic Rim Regional Council (net inflow of 1,559 vessels in 2016, increasing to 1,608 vessels in 2036)
- Cassowary Coast Regional Council (net inflow of 1,131 vessels in 2016, increasing to 1,350 vessels in 2036).

Table 2.8 below summarises the projected size of the recreational boating fleet by LGA of use, between 2016 and 2036.

3 INFRASTRUCTURE DEMAND ASSESSMENT

This section converts recreational boating fleet projections into infrastructure demand projections for boat ramp lanes and landings (i.e. publically accessible deep-draught vessel pontoons) at the LGA level.

In determining infrastructure demand, the assessment estimates the likely number of boats being utilised on a day of average demand. This estimate is described as the active fleet. From here, assumptions are made relating to the relationship between trailable boats and boat ramp lane demand, and the relationship between non-trailable boats and likely landings demand.

Figure 3.1 below outlines the methodology utilised to calculate boat ramp lane and landings demand.

Figure 3.1: Methodology to calculate boat ramp lane and landings demand at the LGA level

3.1 Size of active fleet assumptions

3.1.1 Registration activation rate

TMR recognises three levels of demand for marine facilities, namely:

- off-peak demand typical weekday usage
- average demand taken to be demand for a facility on weekends (and, for certain regional locations, other busy periods)
- peak demand demand for a facility at peak holiday periods or for special events.

The Recreational Boating Facilities Demand Forecasting Study 2011 identified the proportion of the recreational boating fleet likely to use boating facilities for each level of demand (referred to herein as the registration activation rate):

• off-peak demand: 8%

average demand: 14%

• peak demand: 20%.

TMR policy on catering for marine facility demand is as follows:

TMR expects off-peak demand at a given facility to be met in almost all circumstances. Its program of works is aimed at satisfying average demand.

TMR does not cater for peak demand. This is because funds (provided largely by collection of recreational boat registration fees) are stretched meeting demand for basic marine infrastructure such as dredging, landings, breakwaters and boat ramps around the state, and local managing authorities cannot allocate sufficient resources (land and funds) for peak demand days. Scarce foreshore land is in intense demand for other purposes, as is funding.

An initial assessment of demand identified that applying the average demand activation rate statewide substantially overestimated the current and projected demand for facilities in some LGAs, based on complaints and observed levels of congestion at various facilities in those LGAs.

Therefore, unlike the *Recreational Boating Facilities Demand Forecasting Study 2011*, this study has considered differing registration activation rates by LGA.

This approach has been taken to recognise that the level of boat usage is likely to differ by LGA, depending on a range of factors, including access to recreational boating facilities, the range of recreational activities other than boating available to the community, the recreational time available to boat users (for example, retirees are likely to have more available time to undertake boating activities than persons employed on a fulltime basis), and nature of employment (for example, persons who finish work in the early afternoon are likely to have more available time to undertake boating activities than persons who finish work in the evening).

The consultation with LGA and port/water storage managers undertaken by GHD as part of this study indicated that recreational boaters typically use their boat to go fishing. A literature review was undertaken to identify the socio-economic and demographic characteristics of persons who participated in recreational fishing.

Ormsby, Jayne (2004) undertook a survey to identify the social, motivational and experiential aspects of recreational fishing by anglers from Queensland. The survey identified that just under

a quarter of respondents were classified as tradespersons and related workers, significantly higher than any other occupational class.

The Australian Bureau of Statistics (ABS) (2010) considers the participation rate of Australians in a number of sports, including fishing. This research identified that the participation rate for fishing was highest for the 55-64 year age cohort, followed by the 45-54 year age cohort. Interestingly, this result directly contradicts the findings of Department of Agriculture and Fisheries (2014), which identifies recreational fishing participation rates as being highest for the 5-14 year age cohort, and lowest for the 60+ year age cohort.

Participation rates in both studies represent the proportion of persons that participate in fishing in a given year, but do not provide insight as to the frequency of participation in that year. This means that while a certain age cohort may have a high participation rate, these persons may only go fishing once a year, while other age cohorts might have lower participation rates but higher frequency of participation. The literature review did not identify any information in relation to the frequency of participation in fishing or recreational boating by age cohort.

Our assessment has assumed that a higher average age is likely to correspond with a higher frequency of recreational boat usage, due to the greater availability of time for recreational pursuits, such as fishing and boating.

Within each LGA, the following factors were considered in refining the appropriate registration activation rate.

- incidence of blue collar employment (based on 2016 Census)
- average age of residents (based on 2016 Census)
- remoteness classification by local government area (Accessibility/Remoteness Index of Australia (ARIA+))
- whether the LGA was coastal.

ARIA+ is an index of remoteness derived from measures of road distances between populated localities to each of five categories of service centre, namely:

- distance between populated locality and population centre of 250,000+ persons
- distance between populated locality and population centre of 48,000-249,999 persons
- distance between populated locality and population centre of 18,000-47,999 persons
- distance between populated locality and population centre of 5,000-17,999 persons
- distance between populated locality and population centre of 1,000-4,999 persons.

The five distance measurements, one to each level of service centre, is recorded for each populated locality and standardised to a ratio. The ratio is calculated by dividing the measured distance for a given locality by the Australian average (mean) for that category. After applying a threshold of three to each of the ratios, all ratios are summed to produce the ARIA+ score for each populated locality across Australia. An interpolation procedure is then used to derive the index values for larger geographic areas such as LGAs.

ARIA+ is the endorsed measure of remoteness utilised by the ABS.

The fit between the ARIA+ remoteness classifications and our classification is summarised in Table 3.1 below.

Table 3.1: Fit between ARIA+ remoteness classification and EA classification

ARIA+ remoteness classification	EA classification
Highly accessible / accessible	Metropolitan
Moderately accessible	Regional centre
Remote	Remote
Very remote	Very Remote

To determine the appropriate registration activation rate, the following steps were taken:

- All LGAs with an ARIA+ classification of highly accessible or accessible (we have called metropolitan) were assigned a registration activation rate of 8%.
- All LGAs with an ARIA+ classification of moderately accessible (we have called regional centre) were assigned a registration activation rate as follows:
 - If the LGA has a higher incidence of blue collar workers and a higher average age than Queensland – registration activation rate is 12%.
 - For all other LGAs registration activation rate is 10%.
- All LGAs with an ARIA+ classification of remote were assigned a registration activation rate as follows:
 - If the LGA has a higher incidence of blue collar workers and a higher average age than Queensland – registration activation rate is 14%.
 - All other LGAs registration activation rate is 12%.
- All LGAs with an ARIA+ classification of very remote were assigned a registration activation rate of 14%.

After completing this first assessment, the registration activation rates were then adjusted to reflect whether the LGA was coastal or not. If the LGA was coastal, the registration activation rate remained unchanged. However, if the LGA was non-coastal, the registration activation rate was adjusted downwards by 2% (for example, if the registration activation rate was 12% and the LGA was non-coastal, the adjusted activation rate was 10%). This adjustment was made to reflect the extra travel distance required to access recreational boating facilities relative to persons who resided in coastal LGAs. It is considered that the further a person has to travel to access recreational boating facilities, the less often these facilities will typically be utilised. If the registration activation rate was already 8%, the rate remained unchanged.

A further reduction in activation was applied to a number of coastal LGAs in South-east Queensland with a broad offering of recreational activities, including boating, where it was determined that the appropriate registration activation rate was in the order of 6%-7%.

Based on the above criteria, Table 3.2 below summarises the activation rates applied to each LGA in Queensland.

3.1.2 Tourism Adjustment

The following LGAs were considered to record a significant uplift in boating infrastructure demand as a result of tourism activity:

- first tier LGAs:
 - Douglas Shire
 - Cairns Regional Council
 - Whitsunday Regional Council
- second tier LGAs:
 - Townsville City Council
 - Fraser Coast Council
 - Mackay Regional Council
 - Livingstone Shire Council.

The assumed uplift in boat lane demand was assumed to be as follows:

- first tier LGAs: 20% uplift in boat ramp lane and pontoon/landing demand
- second tier LGAs: 10% uplift in boat ramp lane and pontoon/landing demand.

Consultation also identified that the northern coastal LGAs of Burke, Cook and Carpentaria Shire record significant increases in demand for boating infrastructure during winter, with significant inflows of grey nomads. However, it was also identified that boating infrastructure within these LGAs was more than sufficient to accommodate these inflows.

3.2 Projected size of active fleet

Based on the above assumptions, the projected size of the active fleet in Queensland on a day of average demand is projected to increase from 24,298 vessels in 2016 to 32,524 vessels in 2036.

The size of the active fleet on a day of average demand is anticipated to be largest in the following LGAs, reflecting the large population residing in the South-east Queensland area:

- Gold Coast City Council (2,442 vessels in 2016, increasing to 3,764 vessels in 2036)
- Moreton Bay Regional Council (1,628 vessels in 2016, increasing to 2,268 vessels in 2036)
- Brisbane City Council (1,480 vessels in 2016, increasing to 1,969 vessels in 2036)
- Redland City Council (1,314 vessels in 2016, increasing to 1,803 vessels in 2036)
- Sunshine Coast Regional Council (1,195 vessels in 2016, increasing to 1,783 vessels in 2036).

Table 3.3 below summarises the size of the active fleet on a day of average demand between 2016 and 2036.

3.3 Relationship between active fleet and boating infrastructure demand

3.3.1 Conversion of active trailable fleet to boat ramp lane demand

Converting active trailable fleet estimates into boat ramp lane demand has been undertaken based on throughput rates of ramps. In SKM (1988) and Rose et. al. (2009), a rate of 30 boats per lane per day is considered to provide unhampered overall amenity, whereas a rate of 50 boats per lane per day represents congested operations.

It has been assumed that the midpoint (40) between unhampered overall amenity (30 boats per lane per day) and congested operations (50 boats per lane per day) would represent the ideal scenario, as it balances the needs and wants of trailable boat owners against the costs incurred by local governments, port authorities, water storage managers, state governments and the private sector in providing boat ramps.

This assumption is consistent with the assumption made in the Recreational Boating Facilities Demand Forecasting Study 2011.

3.3.2 Relationship between active non-trailable fleet and pontoon/landing demand

The literature review did not uncover any literature relating to public pontoon/landing demand.

Public pontoon/landing demand is driven by the size of the non-trailable fleet. The assessment has assumed that on a given day, an estimated 5% of the active non-trailable fleet is anticipated to demand a public pontoon/landing.

3.4 Projected boat ramp lane demand

Total boat ramp lane demand in Queensland is projected to increase from 563 lanes in 2016 to 757 lanes in 2036 (refer to Table 3.4 below). The LGAs anticipated to record the highest demand for boat ramps are:

- Gold Coast City Council (54 boat ramp lanes in 2016, 83 boat ramp lanes in 2036)
- Moreton Bay Regional Council (38 boat ramp lanes in 2016, 52 boat ramp lanes in 2036)
- Brisbane City Council (33 boat ramp lanes in 2016, 44 boat ramp lanes in 2036)
- Redland City Council (30 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Mackay Regional Council (34 boat ramp lanes in 2016, 46 boat ramp lanes in 2036)
- Fraser Coast Regional Council (34 boat ramp lanes in 2016, 44 boat ramp lanes in 2036)
- Cairns Regional Council (33 boat ramp lanes in 2016, 45 boat ramp lanes in 2036)
- Townsville City Council (29 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Sunshine Coast Regional Council (28 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Bundaberg Regional Council (27 boat ramp lanes in 2016, 34 boat ramp lanes in 2036).

Table 3.4 below identifies that some LGAs have demand for less than one boat ramp lane. These LGAs currently have either little or no public boating infrastructure but recorded vessel registrations.

Table 3.4: Projected boat ramp lane demand by LGA, 2016-2036

Note: Economic Associates estimates, derived from Table 3.3

3.5 Projected pontoon/landing demand

In Queensland, total pontoon/landing demand is projected to increase from 87 pontoons/landings in 2016 to 121 pontoons/landings in 2036.

The LGAs anticipated to have the most significant demand for pontoons/landings are Gold Coast City, Brisbane City, Redland City, Sunshine Coast Regional Council, Cairns Regional Council, Fraser Coast Regional Council and Whitsunday Regional Council.

Table 3.5 below summarises the projected pontoon/landing demand by LGA between 2016 and 2036.

Table 3.5: Projected pontoon / landing demand by LGA, 2016-2036
